- CONTRACTOR SHALL IMMEDIATELY NOTIFY THE CLIENT AND LANDSCAPE DESIGNER OF ANY EXTRA COSTS ARISING FORM THE EXECUTION OF THEIR CONTRACT OR SUBCONTRACTS AND SHALL RECEIVE THE CLIENT'S AND LANDSCAPE DESIGNER'S WRITTEN APPROVAL OF ANY ADDITIONAL COST PRIOR TO EXECUTION OF SAID WORK.
- CONTRACTOR SHALL BE RESPONSIBLE FOR SUPERVISING AND VERIFYING THAT ALL GENERAL AND SUBCONTRACT WORK IS ACCOMPLISHED ACCORDING TO THE MOST CURRENT CONSTRUCTION DOCUMENTS, INCLUDING REVISIONS.
- CONTRACTOR SHALL NOT USE ANY POTENTIALLY HAZARDOUS MATERIALS OR PRODUCTS THROUGHOUT CONSTRUCTION. CONTRACTOR SHALL ADVISE CLIENT AND LANDSCAPE DESIGNER OF ANY POTENTIALLY HAZARDOUS MATERIALS OR PRODUCTS RECOMMENDED, SELECTED, OR SPECIFIED, PRIOR TO THE PURCHASE OR INSTALLATION OF SAID MATERIALS OR PRODUCTS.

SITEWORK NOTES

- PRIOR TO FORMING OR POURING CONCRETE, CONTRACTOR SHALL STAKE OUT ALL PERIMETER LINES AS SHOWN ON PLANS FOR LANDSCAPE DESIGNER'S REVIEW, CONFIRM EXISTING STRUCTURE AND PROPERTY LINE LOCATIONS AND ELEVATIONS, AND VERIFY PROPER SETBACKS AND CLEARANCES BY LOCAL CODES.
- THERE SHALL BE NO TRENCHES OR EXCAVATIONS 5'-0" OR MORE IN DEPTH INTO WHICH A PERSON IS REQUIRED TO DESCEND. IF REQUIRED, CONTRACTOR SHALL OBTAIN NECESSARY PERMIT FROM LOCAL/STATE BUILDING AND SAFETY DEPARTMENTS.
- CONTRACTOR SHALL NOTIFY CLIENT AND LANDSCAPE DESIGNER OF ANY UNSTABLE OR QUESTIONABLE SOIL OR GEOLOGICAL CONDITIONS ENCOUNTERED DURING EXCAVATION.
- CONTRACTOR SHALL PROVIDE POSITIVE DRAINAGE OF ALL FINISHED GRADE SURFACES AND WALKWAYS AWAY FROM STRUCTURES AND VERIFY THAT ALL AREAS AFFECTED BY CONSTRUCTION ARE PROPERLY DRAINED, WITH NO PONDING.
- CONTRACTOR SHALL REMOVE ALL EXCESS SOIL, DEBRIS, AND MATERIALS NOT REQUIRED BY CONSTRUCTION. CONFIRM ANY ITEMS TO REMAIN WITH LANDSCAPE DESIGNER, PRIOR TO START OF CONSTRUCTION.

PLANTING NOTES

GENERAL

- ALL WORK SHALL BE IN ACCORDANCE WITH THESE PLANS, NOTES, DETAILS, AND ALL APPROPRIATE LOCAL CODES.
- PLAN IS DIAGRAMMATIC. CONTRACTOR SHALL VERIFY SITE CONDITIONS. IF ANY CONDITION CONFLICTS WITH PLANS, THE CONTRACTOR SHALL NOTIFY THE LANDSCAPE DESIGNER PRIOR TO ANY PLANTING INSTALLATION.
- THE IRRIGATION SYSTEM SHALL BE INSTALLED COMPLETE AND OPERABLE PRIOR TO ANY PLANTING INSTALLATION EXCEPT AS NOTED IN THESE SPECIFICATIONS.
- CONTRACTOR SHALL VERIFY QUANTITIES BY PLAN CHECK. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ALL QUANTITIES SHOWN ON THE PLAN. SHRUB AND GROUND COVER QUANTITIES SPECIFIED MAY NOT REFLECT QUANTITIES DRAWN.
- PLANT SUBSTITUTIONS WILL BE ALLOWED ONLY WITH WRITTEN APPROVAL FROM THE LANDSCAPE DESIGNER.
- CONTRACTOR SHALL BE RESPONSIBLE FOR DELIVERY COORDINATION OF ALL MATERIALS REQUIRED BY THESE PLANS, NOTES, AND DETAILS.

SCOPE OF WORK

- THE CONTRACTOR SHALL FURNISH ALL MATERIAL, LABOR, TRANSPORTATION, EQUIPMENT, AND PROPERTY IN ORDER TO COMPLETE THE LANDSCAPING OF ALL PLANTING AREAS INDICATED, OR REASONABLY IMPLIED, ON THE DRAWINGS AND/OR NOTES.

  INCLUDED AS A PART OF THE PLANTING INSTALLATION, BUT NOT LIMITED, ARE THE FOLLOWING ITEMS: CLEAR AND GRUB ALL PROPOSED LANDSCAPE AREAS; IMPORT SOIL, FINE GRADING OF ALL PLANTING AREAS; PREPARATION OF ALL PLANTING HOLES; FURNISHING AND INSTALLATION OF ALL REQUIRED PLANTING BACKFILL AND SOIL AMENDMENT MATERIALS, AND MULCH; AND MISCELLANEOUS MATERIALS; FURNISHING AND INSTALLING ALL PLANT MATERIALS; PROVIDING MAINTENANCE THROUGHOUT THE SPECIFIED PERIOD; CLEAN-UP AND WEEDING OF ALL LANDSCAPE AREAS; GUARANTEE OF ALL PLANT MATERIALS AND WORKMANSHIP FOR A PERIOD AS SPECIFIED BELOW.

MATERIALS

- ALL PLANT MATERIALS SHALL BE OF SELECT "A-1" QUALITY AND HAVE A GROWTH HABIT NORMAL TO THE SPECIES AND SHALL BE SOUND, HEALTHY, VIGOROUS AND FREE FROM PESTS, PLANT DISEASES, SUN SCALDS, FRESH BARK ABRASIONS, EXCESSIVE ABRASIONS, OR OTHER OBJECTIONABLE DISFIGUREMENTS. ALL PLANTS SHALL HAVE NORMAL WELL-DEVELOPED BRANCH SYSTEMS, AND VIGOROUS AND FIBROUS ROOT SYSTEMS WHICH ARE NEITHER ROOT NOR POT-BOUND AND ARE FREE OF KINKED OR GIRDLING ROOTS. ALL PLANTS SHALL BE TRUE TO SPECIES AND VARIETY. ALL MATERIALS SHALL BE PROVIDED BY A CERTIFIED NURSERY AND SHALL BE FREE OF ANY PEST OR DISEASE. THE LANDSCAPE DESIGNER RESERVES THE RIGHT TO REJECT ANY UNSUITABLE OR OBJECTIONABLE PLANT MATERIAL.
- TREES, SHRUBS, AND VINES - ALL PLANT MATERIALS SHALL BE OF THE SPECIFIED TYPE AND SIZE, SELECTED FROM HIGH QUALITY, WELL-SHAPED NURSERY STOCK.
- FLATTED PLANTS - ALL GROUND COVER PLANTS AND OTHER FLATTED PLANTS SHALL BE GROWN AND REMAIN IN THE FLATS UNTIL TRANSPLANTED AT THE SITE. THE SOIL AND SPACING OF THE PLANTS IN THE FLAT SHALL INSURE THE MINIMUM DISTURBANCE OF THE ROOT SYSTEM AT THE TIME OF TRANSPLANTING.
- THE CONTRACTOR SHALL KEEP ALL PLANT MATERIAL DELIVERED TO THE SITE IN A HEALTHY CONDITION FOR PLANTING. PLANTS SHALL NOT BE ALLOWED TO DRY OUT.
- ALL PLANT MATERIALS SHALL BE APPROVED BY THE LANDSCAPE DESIGNER PRIOR TO INSTALLING PLANT MATERIAL. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE CONDITION OF ALL PLANTS, PLANTED OR OTHERWISE, UNTIL ACCEPTANCE.
- TOPSOIL - TOP SOIL SHALL BE CLASS 'A' WITH THE SAME RELATIVE COMPOSITION AND STRUCTURE, A FRIABLE SANDY LOAM CHARACTER; AND BE FREE OF ROOTS, CLODS, AND STONES LARGER THAN 1 INCH IN GREATEST DIMENSION, POCKETS OF COURSE SAND, NOXIOUS WEEDS, STICKS, SLAG, BRUSH, AND OTHER MATTER. IT SHALL NOT BE INFESTED WITH NEMATODES OR OTHER UNDESIRABLE INSECTS AND PLANT DISEASE ORGANISMS. TOPSOIL PH RANGE SHALL BE 5.3 TO 6.0.
- AGRONOMIC SOILS TEST - CONTRACTOR SHALL OBTAIN AND SUBMIT FOR APPROVAL, A WRITTEN AGRONOMIC SOILS TEXT REPORT FROM A STATE REGISTERED TESTING AGENCY FOR ALL IMPORTED AND SITE TOPSOIL TO BE USED ON THE SITE. TEST REPORT SHALL LIST RECOMMENDED SOIL AMENDMENTS AND PREPARATION TO INSURE ADEQUATE PLANT GROWTH. CONTRACTOR SHALL ADJUST HIS BID ACCORDING TO THE RECOMMENDATIONS LISTED IN THE SOILS TEST REPORT.
- FERTILIZERS - ALL FERTILIZING MATERIALS SHALL COMPLY WITH THE APPLICABLE REQUIREMENTS OF THE STATE AGRICULTURAL CODE. ALL FERTILIZING MATERIALS SHALL BE PACKAGED, FIRST GRADE, COMMERCIAL QUALITY PRODUCTS IDENTIFIED AS TO SOURCE, TYPE OF MATERIAL, WEIGHT AND MANUFACTURER'S GUARANTEED ANALYSIS. FERTILIZING MATERIAL SHALL NOT CONTAIN TOXIC INGREDIENTS OR FILLERS IN QUANTITIES HARMFUL TO HUMAN LIFE, ANIMALS, OR PLANT LIFE.
- COMMERCIAL FERTILIZERS - COMMERCIAL FERTILIZER SHALL BE A PALLETIZED OR GRANULAR PRODUCT HAVING A CHEMICAL ANALYSIS AS SPECIFIED ON THE PLANS OR IN THESE SPECIFICATIONS.
- ORGANIC SOIL AMENDMENT - ORGANIC SOIL AMENDMENT SHALL BE A WELL COMPOSTED ORGANIC BASE, CLASS I OR CLASS II. WOOD BASED PRODUCTS ARE CONDITIONALLY ACCEPTABLE (STABLE HUMUS MUST BE PRESENT). WOOD BASED PRODUCTS ARE NOT ACCEPTABLE WHICH ARE BASED ON RED WOOD OR CEDAR. SLUDGE-BASED MATERIALS ARE NOT ACCEPTABLE.

INSTALLATION

- INSTALL ALL PLANT MATERIALS AS PER PLANS, NOTES, AND DETAILS.
- PLANTING AREAS SHALL BE FREE OF WEEDS AND OTHER EXTRANEOUS MATERIALS TO A DEPTH OF 12 INCHES BELOW FINISH GRADE BEFORE TOPSOIL WORK.
- CONTRACTOR SHALL BE RESPONSIBLE FOR FINISH GRADE, INCLUDING AND IMPORT SOIL ADJUSTMENTS TO EARTH BERMS AND SLOPE SHAPES. PROVIDE FINISH GRADE IN PLANTING AREAS AT A MINIMUM 2% MINIMUM GRADIENT. FINISH GRADES SHALL BE 2" BELOW ADJACENT WALKS, CURBS, DRIVEWAYS, ETC. IN GROUND COVER AREAS.
- FINISH GRADE - THE FINISH GRADE SHALL BE SMOOTH, UNIFORM, AND FREE OF ABRUPT GRADE CHANGES AND DEPRESSIONS TO INSURE SURFACE DRAINAGE. ALL PLANTED AREAS SHALL BE RAKED AND SMOOTHED TO THE REQUIRED GRADES AND CONTOURS PRIOR TO INSTALLATION. FINISH SURFACES SHALL BE CLEAN AND SUITABLE FOR PLANTING.
- ALLOW THE LANDSCAPE DESIGNER TO ADJUST PLANT LOCATIONS PRIOR TO ANY PLANTING.
- ALL LANDSCAPED AREAS SHALL BE PLANTED WITH GROUND COVER AS SHOWN ON THE PLANS. GROUND COVER SHALL BE ROOTED TIP CUTTINGS FROM FLATS AND SHALL BE PLANTED IN STAGGERED ROWS CONTINUOUSLY UNDER ALL TREES AND SHRUBS IN THE AREAS DESIGNATED ON THE PLANS AND AT THE SPACING INDICATED IN THE PLANT LEGEND.
- AMEND ALL PLANT AREAS AS FOLLOWS:

  *SOIL SPECIFICATIONS PROVIDED FOR BID PURPOSES ONLY. CONTRACTOR SHALL ADJUST AMENDMENTS AND BID BASED UPON LAB SOIL TEST PROVIDED BY THE CONTRACTOR. TEST AND REPORT SHALL BE FROM A CERTIFIED SOILS LABORATORY AND SHALL PROVIDE A COMPLETE REGULAR ANALYSIS, ORGANIC MATTER CONTENT, AND TEXTURAL CHARACTERISTICS. A MINIMUM OF ONE SAMPLE AT EACH OF THE FOLLOWING DEPTHS: 0"-12", 12"-24", AND 24"-36". PRIOR TO CONSTRUCTION, THE CONTRACTOR SHALL SUBMIT A COPY OF THE FINAL SOILS REPORT TO THE LANDSCAPE DESIGNER FOR REVIEW AND APPROVAL.

  1. SOIL IMPROVEMENT FOR ALL PLANTER AREAS:

     ROTOTILL THE FOLLOWING AMENDMENTS 6-8" DEEP AND IRRIGATE THOROUGHLY:
- 2 CU YDS WELL COMPOSTED CLASS I OR CLASS II ORGANIC MATTER PER 1,000 SQ FT
- 100 LBS OF *TURF-PLUS* [AVAILABLE AT AGUINAGA FERTILIZER COMPANY, (909) 899-1203]
- 25 LBS AGRICULTURAL GYPSUM PER 1,000 SQ FT

  2. BACKFILL MIX FOR TREES, SHRUBS, AND VINES SHALL BE AS FOLLOWS:
- 80% BY VOLUME NATIVE ON-SITE SOIL
- 20% BY VOLUME WELL COMPOSTED CLASS I OR CLASS II ORGANIC MATTER

SOIL AMENDMENT APPLICATION RATES

GENERAL SOIL PREPARATION: APPLY 70 LBS. PER 1,000 SQ. FT.

PROBLEM OR COMPACTED SOILS: APPLY 90-100 LBS. PER 1,000 SQ. FT

- PLANT INSTALLATION - PLANTING HOLES SHALL BE APPROXIMATELY SQUARE WITH THE VERTICAL SIDES TWICE THE DEPTH AND WIDTH OF THE PLANT CONTAINER OR BALL, AND SHALL BE LARGER IF NECESSARY TO PERMIT HANDLING AND PLANTING WITHOUT INJURY OR BREAKAGE OF THE ROOT BALL OR ROOT SYSTEM. ANY PLANT WITH A BROKEN OR CRACKED ROOT BALL BEFORE OR DURING PLANTING SHALL NOT BE PLANTED.
- THE NATIVE SOIL AT THE BOTTOM OF THE PLANTING HOLES SHALL BE SCARIFIED TO A DEPTH OF 6 INCHES.
- AFTER PLANTING, THE PLANT SHALL BE PLUMB WITH THE ROOT CROWN AT ITS NATURAL GROWING DEPTH WITH RESPECT TO FINISH GRADE. BACKFILL SHALL BE THOROUGHLY WATER-SETTLED AND ADDITIONAL PREPARED SOIL MIX ADDED TO FILL ANY REMAINING VOID BELOW FINISH GRADE. A CIRCULAR WATERING BASIN SLIGHTLY LARGER THAN THE PLANTING HOLE SHALL BE LEFT AROUND THE PLANT. THE BOTTOM OF THE BASIN SHALL BE AT APPROXIMATELY FINISH GRADE OR SLIGHTLY LOWER. MULCH SHALL BE SPREAD AT LEAST 1 INCH THICK IN THE BASIN. THE AREA AROUND PLANTS SHALL BE REGRADED TO FINISH GRADE. THE EXCESS SOIL SHALL BE DISPOSED OF BY THE CONTRACTOR. ALL TREES SHALL BE STAKED AND GUYED PER DETAILS.
- MULCH - ALL LANDSCAPED AREAS SHALL BE MULCHED WITH SPECIFIED MULCH. BARK SHALL BE OF A RELATIVE UNIFORM PARTICLE SIZE WITH A MEDIAN SIZE NO GREATER THAN 1 1/2" IN DIAMETER. CONTRACTOR SHALL PROVIDE A SAMPLE OF BARK MULCH TO THE LANDSCAPE DESIGNER FOR APPROVAL. MULCH SHALL BE INSTALLED TO A MIN. DEPTH OF 3".

MAINTENANCE AND WARRANTIES

- THE MAINTENANCE PERIOD SHALL COMMENCE UPON THE OWNER'S AND THE LANDSCAPE DESIGNER'S WRITTEN APPROVAL OF ALL PHASES OF PLANTING INSTALLATION AND SHALL BE:
  1. WARRANTY PERIOD FOR TREES, SHRUBS AND PLANT MATERIAL OVER 15 GALLONS: ONE YEAR FROM DATE OF FINAL INSPECTION AND ACCEPTANCE.
  2. WARRANTY PERIOD FOR 15 GALLON PLANTS: SIX MONTHS FROM DATE OF FINAL INSPECTION AND ACCEPTANCE
  3. WARRANTY PERIOD FOR 5 GALLON PLANTS: SIX MONTHS FROM DATE OF FINAL INSPECTION AND ACCEPTANCE

FOR BID PURPOSES ONLY: MAINTENANCE WORK SHALL INCLUDE A MINIMUM TWO (2) FERTILIZER APPLICATIONS TO ALL PLANTING AREAS DURING THE MAINTENANCE PERIOD. AT THE FIRST SIGN OF A DEFICIENCY UP TO THIRTY (30) DAYS, THE CONTRACTOR SHALL TEST A MINIMUM OF ONE SOIL SAMPLE FROM GROUND COVER AREAS TO DETERMINE FERTILIZER NEEDS FOR APPLICATION.

- MAINTENANCE PROCEDURES - THE GENERAL CARE AND MAINTENANCE OF ALL AREAS SHALL CONSIST OF PROPER WATERING, FERTILIZATION, WEEDING, CLEAN-UP, AND AS FOLLOWS:
  1. CULTIVATE AND WEED AT NOT LESS THAN TEN (10) WORKING DAY INTERVALS.
  2. APPROXIMATELY THIRTY (30) DAYS AFTER INITIAL PLANTING, APPLY (2) 5 LBS 16-6-8 FERTILIZER PER 1,000 SQ FT. APPLY AND THOROUGHLY IRRIGATE. THE SECOND APPLICATION USING THE ABOVE SPECIFIED FERTILIZER AT THE SAME RATE SHALL BE APPLIED IN ANOTHER SIXTY (60) DAYS OR JUST BEFORE MAINTENANCE PERIOD ENDS.
  3. CONTRACTOR SHALL MAINTAIN THE IRRIGATION SYSTEM IN A LIKE NEW, OPERATING CONDITION, ADJUSTING HEAD HEIGHTS, THROW AND SPRAY ARCS AS NECESSARY. THE CONTRACTOR SHALL BE RESPONSIBLE FOR PROPER WATERING OF ALL PLANTING AREAS, AND SHALL REPLACE ANY PLANT MATERIALS DAMAGED DUE TO IMPROPER MOISTURE.
  4. ANY CONCENTRATED DEVELOPMENT OF WEED GROWTH THAT MAY APPEAR IN PLANTING AREAS DURING MAINTENANCE PERIOD SHALL BE REMOVED AT THIRTY (30) DAY INTERVALS. THE CONTRACTOR MAY ELECT TO REMOVE SUCH CONCENTRATIONS OF WEEDS MANUALLY OR BY AN APPROVED HERBICIDE PROGRAM. THE CONTRACTOR SHALL CONSULT THE LANDSCAPE DESIGNER PRIOR TO USING ANY HERBICIDE.
  5. DURING THE COURSE OF THE MAINTENANCE WORK, THE CONTRACTOR SHALL REMOVE SURPLUS MATERIALS AND DEBRIS FROM THE SITE AND SHALL KEEP THE PREMISES IN A NEAT AND CLEAN CONDITION AT ALL TIMES.
  6. DURING THE MAINTENANCE PERIOD, THE CONTRACTOR SHALL BE RESPONSIBLE FOR MAINTAINING ADEQUATE PROTECTION FOR ALL PLANTING AREAS. ANY DAMAGE TO AREAS SHALL BE IMMEDIATELY REPAIRED AT THE CONTRACTOR'S EXPENSE.

TREE PRESERVATION GUIDELINES DURING CONSTRUCTION

BEFORE CONSTRUCTION WORK BEGINS, WHICH WILL IMPACT A TREE, AN ARBORIST SHALL ASSESS THE IMPACT OF CONSTRUCTION BASED ON THE CONDITION OF THE TREE. MITIGATING MEASURES NECESSARY TO PROTECT THE TREE WILL BE STATED AND REVIEWED BY THE TEAM.

THE FOLLOWING GUIDELINES HAVE BEEN DEVELOPED TO PROTECT TREES DURING CONSTRUCTION PROJECTS:

A. A ROOT PROTECTION ZONE SHALL BE DEFINED BY A FOUR-FOOT HIGH TWO-BY-FOUR BARRIER CONSTRUCTED AROUND ANY POTENTIALLY IMPACTED TREE. THIS BARRIER SHALL BE AT THE DRIP LINE OR AT A DISTANCE FROM THE TRUNK EQUAL TO 6 INCHES FOR EACH INCH OF TRUNK DIAMETER 4 ½ FEET ABOVE THE GROUND IF THIS METHOD DEFINES A LARGER AREA.

B. SHOULD IT BE NECESSARY TO TRENCH WITHIN THIS AREA, TRENCHES SHALL BE HAND DUG. NO ROOTS LARGER THAN TWO INCHES SHALL BE CUT UNLESS NO OTHER ALTERNATIVE IS FEASIBLE. ALL ROOTS GREATER THAN TWO (2) INCHES IN DIAMETER MUST BE CLEANLY CUT TO ENCOURAGE GOOD CALLUS TISSUE. IT IS RECOMMENDED THAT ROOTS BE PRUNED BACK TO THE NEXT ROOT NODE.

C. ALL SMALLER ROOTS THAT MUST BE CUT SHALL BE SAW CUT (NO TRENCHERS) FLUSH WITH THE SIDE OF THE TRENCH. IF AT ANY TIME 25 PERCENT OF THE AREA WITHIN THE ROOT PROTECTION ZONE IS BEING SEPARATED FROM THE TREE BY A TRENCH, THE LINE SHALL BE LOCATED BY BORING OR AN ALTERNATE LOCATION FOR THE TRENCH ESTABLISHED.

D. THE MINIMUM CLEARANCE BETWEEN AN OPEN TRENCH AND A STREET TREE SHALL BE ONE (1) FOOT, OR SIX (6) INCHES FOR EACH INCH OF TRUNK DIAMETER MEASURED AT 4.5 FEET ABOVE EXISTING GRADE IF THIS METHOD DEFINES A LARGER DISTANCE. THE MAXIMUM CLEARANCE SHALL BE TEN (10) FEET. THE CONTRACTOR SHALL CONFORM TO THESE PROVISIONS UNLESS OTHERWISE DIRECTED BY AN ARBORIST.

E. AT NO TIME SHALL ANY EQUIPMENT, MATERIALS, SUPPLIES OR FILL BE ALLOWED WITHIN THE PRESCRIBED ROOT PROTECTION ZONE UNLESS OTHERWISE DIRECTED BY THE CITY. THE ROOT PROTECTION ZONE IS DEFINED AS THE LARGER OF THE DRIP LINE OF THE TREE OR THE DISTANCE FROM THE TRUNK EQUAL TO SIX (6) INCHES FOR EACH INCH OF TRUNK DIAMETER MEASURED AT 4.5 FEET ABOVE EXISTING GRADE.

F. REPAIR OR REPLACE TREES AND VEGETATION INDICATED TO REMAIN THAT ARE DAMAGED BY CONSTRUCTION OPERATIONS, IN A MANNER APPROVED BY ARCHITECT.
  1. EMPLOY A QUALIFIED ARBORIST, LICENSED IN JURISDICTION WHERE PROJECT IS LOCATED, TO SUBMIT DETAILS OF PROPOSED REPAIRS AND TO REPAIR DAMAGE TO TREES AND SHRUBS.
  2. REPLACE TREES THAT CANNOT BE REPAIRED AND RESTORED TO FULL-GROWTH STATUS, AS DETERMINED BY THE QUALIFIED ARBORIST.

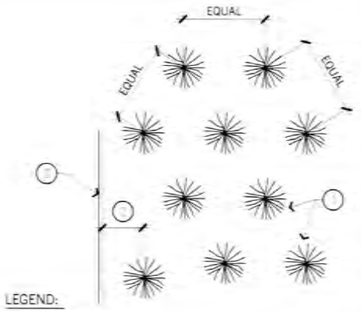
SELECTIVE NOTES

A MINIMUM 3-INCH LAYER OF MULCH SHALL BE APPLIED ON ALL EXPOSED SOIL SURFACES OF PLANTING AREAS EXCEPT TURF AREAS, CREEPING OR ROOTING GROUNDCOVERS, OR DIRECT SEEDING APPLICATIONS WHERE MULCH IS CONTRAINDICATED.

FOR SOILS LESS THAN 6% ORGANIC MATTER IN THE TOP 6 INCHES OF SOIL, COMPOST AT A RATE OF A MINIMUM OF FOUR CUBIC YARDS PER 1000 SQUARE FEET OF PERMEABLE AREA SHALL BE INCORPORATED TO A DEPTH OF 6 INCHES INTO THE SOIL.

USE OF CLASS I OR CLASS II COMPOST AS A SOIL AMENDEMENT IN ALL LANDSCAPE AREAS.

PRESSURE REGULATING DEVICES ARE REQUIRED IF WATER PRESSURE IS BELOW OR EXCEEDS THE RECOMMENDED PRESSURE OF THE SPECIFIED IRRIGATION DEVICES.



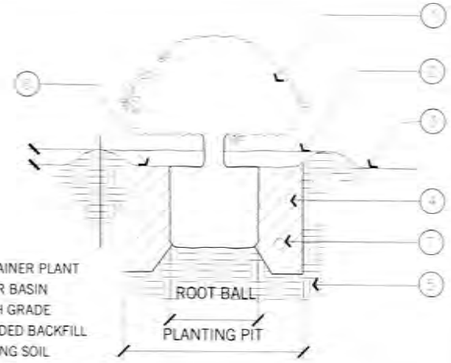
CHECK VALVES OR ANTI-DRAIN VALVES ARE REQUIRED ON ALL SPRINKLER HEADS WHERE LOW POINT DRAINAGE COULD OCCUR.

A DIAGRAM OF THE IRRIGATION PLAN SHOWING HYDROZONES SHALL BE KEPT WITH THE IRRIGATION CONTROLLER FOR SUBSEQUENT MANAGEMENT PURPOSES.

A CERTIFICATE OF COMPLETION SHALL BE FILLED OUT AND CERTIFIED BY EITHER THE DESIGNER OF THE LANDSCAPE PLANS, IRRIGATION PLANS, OR THE LICENSED LANDSCAPE CONTRACTOR FOR THE PROJECT.

AN IRRIGATION AUDIT REPORT SHALL BE COMPLETED AT THE TIME OF FINAL INSPECTION.

RECIRCULATING WATER SYSTEMS SHALL BE USED FOR WATER FEATURES.



LEGEND:

1. LOCATE PLANTS WITH EQUAL SPACING AS INDICATED ON PLAN (TRIANGULAR SPACING).
2. 1/2 ON-CENTER SPACING.
3. FACE OF BUILDING, PAVING, OR HEADER SHOWING AREA LIMIT.

ENLARGED PLANTING PLAN

L2.24

SPECIAL IRRIGATION NOTES

1. CONTRACTOR SHALL ADJUST ALL IRRIGATION HEADS AS REQUIRED TO ACCOMMODATE ALL/ANY VERTICAL OBSTRUCTIONS THAT MAY OCCUR, INCLUDING LIGHT POLES AND FIRE HYDRANTS. VERIFY ALL HEAD/BUBBLER/DRIPLINE LAYOUT WITH OWNERS AUTHORIZED REPRESENTATIVE PRIOR TO START OF WORK.
2. BUBBLERS AND LATERAL LINES ARE SHOWN ON PLAN WITHIN PAVING AREAS ARE FOR GRAPHICS CLARITY ONLY. ACTUAL LOCATION TO BE WITHIN PLANTER. BUBBLERS SHALL BE ALIGNED WITH TREES AND AS DIRECTED BY OWNERS AUTHORIZED REPRESENTATIVE. CONFIRM ALL LAYOUT IN FIELD WITH OWNER'S REP PRIOR TO START OF WORK.
3. ANY IRRIGATION LATERAL LINE PIPING SHOWN WITHIN BUILDING AREAS SHALL BE A TYPE K COPPER AND IS SHOWN FOR GRAPHIC CLARITY ONLY. ACTUAL DESIGN AND ROUTING OF SUCH SHALL BE COMPLETED BY PLUMBING ENGINEER AND INSTALLED BY PLUMBING CONTRACTOR. ALL PIPING THROUGH BUILDING EXTERIOR AND THROUGH BUILDING TO UPPER FLOORS SHALL BE PROVIDE BY PLUMBER.

REFERENCE NOTES SCHEDULE PLAN

SYMBOL	DESCRIPTION
1	NEW 1 1/2" LANDSCAPE WATER METER (INSTALLED BY OTHERS). EXACT LOCATION SHALL BE CONFIRMED ON SITE. INSTALLING CONTRACTOR SHALL COORDINATE WITH THE GENERAL CONTRACTOR, PRIOR TO START OF CONSTRUCTION.
2	NEW 1 1/2" (REDUCED PRESSURE) BACKFLOW PREVENTION ASSEMBLY AND PRESSURE REGULATOR. EXACT LOCATION SHALL BE DETERMINED ON SITE. LANDSCAPE ARCHITECT TO APPROVE FINAL LOCATION ON SITE.
3	CONTRACTOR TO ADJUST PRESSURE REGULATOR AT THIS LOCATION. SET STATIC WATER PRESSURE NOT TO EXCEED 95 PSI.
4	IRRIGATION PLAN IS DIAGRAMMATIC. ALL PIPING, VALVES AND HEADS ARE TO BE LOCATED IN PLANTING AREAS WHEREVER POSSIBLE.
5	ONE FIFTY FOUR (54) STATION AUTOMATIC ET CONTROLLER ASSEMBLY (INSTALLED AS SHOWN ON PLAN). INSTALLING CONTRACTOR SHALL COORDINATE INSTALLATION AND EXACT LOCATION PRIOR TO START OF CONSTRUCTION. A MINIMUM (2") ELECTRICAL CONDUIT FROM NEW CONTROLLER LOCATION TO ON-GRADE PLANTING AREA, PROVIDED BY OTHERS. INSTALLING CONTRACTOR SHALL VERIFY AND COORDINATE EXACT LOCATION OF STUB-OUTS AND ROUTING OF CONDUIT WITH THE GENERAL CONTRACTOR ON SITE, PRIOR TO START OF CONSTRUCTION.
7	AUTOMATIC ET CONTROLLER AND ALL OTHER IRRIGATION EQUIPMENT LOCATIONS SHOWN ON THIS DRAWING ARE APPROXIMATE. STAKE OUT ALL IRRIGATION EQUIPMENT LOCATIONS FOR REVIEW AND APPROVAL BY OWNER PRIOR TO INSTALLATION. FINAL LOCATION AND EXACT POSITIONING OF ALL IRRIGATION EQUIPMENT SHALL BE DETERMINED BY THE OWNERS REPRESENTATIVE.
8	ET SENSOR ASSEMBLY MOUNTED TO EXTERIOR WALL OF BLDG. (EXACT LOCATION SHALL BE DETERMINED AND APPROVED ON SITE BY LANDSCAPE ARCHITECT.
9	MASTER VALVE (1 1/2") EXACT LOCATION SHALL BE DETERMINED ON SITE. LANDSCAPE ARCHITECT TO APPROVE FINAL LOCATION ON SITE.
10	NEW 1 " FLOW SENSOR, EXACT LOCATION SHALL BE DETERMINED ON SITE. CONTRACTOR TO INSTALL PER MANUFACTURERS INSTRUCTIONS.
11	POC FROM CISTERN/PUMP ASSEMBLY (BY OTHERS). 25 GPM, 75 PSI (MIN)
12	MAKE UP WATER LINE.

SYMBOL	MANUFACTURER/MODEL/DESCRIPTION
	Rain Bird PEB-PRS-D 1", 1-1/2", 2" Plastic Industrial Valves. Low Flow Operating Capability, Globe Configuration. With Pressure Regulator Module.
	LASCO Fittings TUBV-SC 1", 1-1/2", 2", and 3" Plastic Full Block True Union Ball Valve. Shut Off/Isolation Valve to Eliminate Water Hammer. Install same size as mainline.
MV	Buckner-Superior 3200 1-1/2" Normally Closed Brass Master Valve that Provides Dirty Water Protection and No Minimum Flow Feature, which ensures reliable opening and closing of the valve in extreme high or low flow scenarios. Available in 3/4",1"1-1/2",2",2-1/2" and 3".

PROJECT NO: 2021

These drawings, specifications, ideas, designs, and arrangements presented thereby, are and shall remain the property of [place]. No part thereof shall be copied, disclosed to others or used in connection with any work or project other than the specific project for which they have been prepared and developed without the written consent of [place]. Visual contact with these drawings or specifications shall constitute conclusive evidence of acceptance of these restrictions.

IRRIGATION LEGEND

L 5.26

NOT FOR CONSTRUCTION

GENERAL NOTES

1. ALL LOCAL MUNICIPAL AND STATE LAWS, RULES AND REGULATIONS GOVERNING OR RELATING TO ANY PORTION OF THIS WORK ARE HEREBY INCORPORATED INTO AND MADE A PART OF THESE SPECIFICATIONS AND THEIR PROVISIONS SHALL BE CARRIED OUT BY THE CONTRACTOR. IN CASE OF CONFLICT BETWEEN THE SPECIFICATIONS, DRAWINGS, AND/OR CODE, THE MORE STRINGENT REQUIREMENT SHALL PREVAIL.

2. THE CONTRACTOR SHALL VERIFY THE LOCATIONS OF ALL EXISTING UTILITIES, STRUCTURES AND SERVICES BEFORE COMMENCING WORK. THE LOCATIONS OF UTILITIES, STRUCTURES AND SERVICES SHOWN IN THESE PLANS ARE APPROXIMATE ONLY. ANY DISCREPANCIES BETWEEN THESE PLANS AND ACTUAL FIELD CONDITIONS SHALL BE REPORTED TO THE OWNER'S REPRESENTATIVE. CONTRACTOR WILL NOT FASTEN ANY PORTION OF THE IRRIGATION SYSTEM TO ANY STRUCTURE, WALL, PATH OR ANY HARDSCAPE WITHOUT THE PERMISSION OF THE LANDSCAPE ARCHITECT OR OWNER.

3. THE CONTRACTOR SHALL OBTAIN THE PERTINENT ENGINEERING OR ARCHITECTURAL PLANS BEFORE BEGINNING WORK.

4. THE CONTRACTOR SHALL OBTAIN ALL NECESSARY PERMITS REQUIRED TO PERFORM THE WORK INDICATED HEREIN BEFORE BEGINNING WORK.

5. THE MAINLINE AND SLEEVING IS DIAGRAMMATIC. ALL PIPING IS FOR DESIGN CLARIFICATION ONLY AND SHALL BE INSTALLED WITHIN LIMIT OF WORK BOUNDARIES. AVOID ANY CONFLICTS BETWEEN THE IRRIGATION SYSTEM, PLANTING, STRUCTURES AND ARCHITECTURAL FEATURES.

6. IRRIGATION EQUIPMENT AS SHOWN IS DIAGRAMMATIC. INSTALL ALL THE IRRIGATION REMOTE CONTROL VALVES, QUICK COUPLERS, MASTER VALVES, FLOW SENSORS, BACKFLOWS, AIR/VACUUM DEVICES, BALL VALVES, AND ANCILLARY EQUIPMENT IN SHRUB PLANTING AREAS WHEN FEASIBLE OR AS APPROVED BY OWNER'S REPRESENTATIVE AND THE LANDSCAPE IRRIGATION DESIGNER.

7. DO NOT WILLFULLY INSTALL ANY EQUIPMENT AS SHOWN ON THE PLANS WHEN IT IS OBVIOUS IN THE FIELD THAT UNKNOWN CONDITIONS EXIST THAT WERE NOT EVIDENT AT THE TIME THESE PLANS WERE PREPARED. ANY SUCH CONDITIONS SHALL BE BROUGHT TO THE ATTENTION OF THE OWNER'S REPRESENTATIVE PRIOR TO ANY WORK OR THE IRRIGATION CONTRACTOR SHALL ASSUME ALL RESPONSIBILITY FOR ANY FIELD REVISIONS DEEMED NECESSARY BY THE OWNER.

8. INSTALL ALL EQUIPMENT AS SHOWN IN THE DETAILS AND SPECIFICATIONS. CONTRACTOR SHALL BE RESPONSIBLE TO COMPLY WITH LOCAL CITY, COUNTY, AND STATE REQUIREMENTS FOR BOTH EQUIPMENT AND INSTALLATION. ACTUAL LOCATION FOR THE INSTALLATION OF ANCILLARY EQUIPMENT INCLUDING, BUT NOT LIMITED TO, THE BACKFLOW PREVENTER, PUMP STATION (IF APPLICABLE) AND THE AUTOMATIC CONTROLLER IS TO BE DETERMINED IN THE FIELD BY THE OWNER'S AUTHORIZED REPRESENTATIVE.

9. CONTRACTOR IS TO PROVIDE THREE (3) ADDITIONAL PILOT WIRES AND ONE (1) COMMON WIRE TO THE END OF THE MAINLINE RUN IN TWO DIRECTIONS FROM THE CONTROLLER. THE ADDITIONAL WIRE SHALL BE EXTENDED 10', MAKING A COIL TO FIT INSIDE A RECTANGULAR PULL BOX. LABEL THE LID OF THE PULL BOX 'SW'.

10. ALL PIPE UNDER PAVED AREAS, HARDSCAPE, OR AS DIRECTED BY OWNERS REPRESENTATIVE TO BE INSTALLED IN SLEEVING, TWICE THE DIAMETER OF PIPE OR WIRE BUNDLE CARRIED. ALL 4" AND SMALLER SLEEVING SHALL BE PVC1220 SCH. 40, TYPE 1, GRADE 2 MATERIAL CONFORMING TO ASTM STANDARD D-1785-4. ALL 6" AND LARGER SLEEVING SHALL BE PVC1220 CLASS 200 SDR21, TYPE 1, GRADE 2 MATERIAL CONFORMING TO ASTM STANDARD D-2241. SLEEVES TO EXTEND AT LEAST 12" PAST THE EDGE OF PAVING.

11. ALL QUICK COUPLER VALVES (IF APPLICABLE) TO BE INSTALLED IN SHRUB OR GROUND COVER AREAS WHERE POSSIBLE. ALL QUICK COUPLER VALVES TO BE INSTALLED AS SHOWN ON THE INSTALLATION DETAILS. INSTALL QUICK COUPLER VALVES WITHIN 18" OF HARDSCAPE OR AS NOTED ON PLANS.

12. THE IRRIGATION CONTRACTOR SHALL ADJUST THE PRESSURE REGULATOR ON EACH ELECTRIC CONTROL VALVE SO THAT THE SPRINKLER HEAD FARTHEST AND HIGHEST IN ELEVATION FROM ITS RESPECTIVE CONTROL VALVE OPERATES WITHIN THE OPERATING PRESSURE SHOWN ON THE IRRIGATION LEGEND. NOT TO EXCEED FIVE (5) PSI ABOVE THE GIVEN OPERATING PRESSURE FROM THE SPECIFIED PRESSURE LOCATED ON THE IRRIGATION LEGEND.

13. THE IRRIGATION SYSTEM DESIGN IS BASED ON THE MINIMUM OPERATING PRESSURE AND THE MAXIMUM FLOW DEMAND SHOWN ON THE IRRIGATION DRAWINGS AT EACH POINT OF CONNECTION. THE IRRIGATION CONTRACTOR SHALL VERIFY WATER PRESSURE BY DIRECT FIELD MEASUREMENT PRIOR TO CONSTRUCTION. REPORT ANY DIFFERENCE BETWEEN THE WATER PRESSURE INDICATED ON THE DRAWINGS AND THE ACTUAL PRESSURE READING AT THE IRRIGATION POINT OF CONNECTION TO THE OWNER'S AUTHORIZED REPRESENTATIVE. IN THE EVENT PRESSURE DIFFERENCES ARE NOT REPORTED PRIOR TO START OF CONSTRUCTION, THE IRRIGATION CONTRACTOR SHALL ASSUME FULL RESPONSIBILITY AND COSTS FOR ANY REVISIONS.

14. SHOULD FIELD CONDITIONS REQUIRE PIPE INSTALLATION OTHER THAN THAT SHOWN ON PLANS, THE CONTRACTOR SHALL LIMIT EXCESS FLOW AND SIZE ALL PIPE NOT TO EXCEED A VELOCITY OF 5 FEET PER SECOND (FPS) IN PVC PIPE AND CAST IRON PIPE. FLOW THROUGH ANCILLARY EQUIPMENT, STEEL AND COPPER PIPE SHALL NOT EXCEED A VELOCITY OF 7.5 FPS. ALL ADJUSTMENTS SHALL BE MADE AT NO ADDITIONAL COST TO THE OWNER.

15. ELECTRICAL POWER SOURCE FOR THE IRRIGATION CONTROLLER AND/OR BOOSTER PUMP (IF APPLICABLE) SHALL BE PROVIDED UNDER THE ELECTRICAL SECTION OF THE SPECIFICATIONS. IT SHALL BE THE RESPONSIBILITY OF THE IRRIGATION CONTRACTOR TO COORDINATE ELECTRICAL SERVICE WITH THE GENERAL CONTRACTOR AND SHALL MAKE THE FINAL CONNECTION FROM THE ELECTRICAL SOURCE TO THE CONTROLLER AND/OR BOOSTER PUMP.

16. LANDSCAPE CONTRACTOR SHALL PROVIDE CLIENT WITH "AS BUILT" IRRIGATION ZONE PLAN CONTAINING ALL IRRIGATION ZONES, VALVE BOXES, MAIN LINES, HOSE BIBS, CONTROLLER, AND MASTER ASSEMBLY.

17. THE IRRIGATION DESIGNER OR LANDSCAPE DESIGNER OR LANDSCAPE ARCHITECT SHALL NOT BE RESPONSIBLE UNDER ANY CIRCUMSTANCES FOR THE QUALITY OR TIMELINESS OF PERFORMANCE OF THE WORK INCLUDING BUT NOT LIMITED TO THE INSTALLATION OF THE BACKFLOW PREVENTION ASSEMBLY MAINLINE, LATERALS, VALVES, SPRINKLER HEADS, DRIP IRRIGATION EQUIPMENT, CONTROL WIRE, CONTROLLERS AND SENSORS (IF APPLICABLE). THE RESPONSIBILITY FOR SAME SHALL REST WITH THE CONTRACTOR PERFORMING THE WORK.

OWNERS RESPONSIBILITY

18. THE OWNER IS RESPONSIBLE FOR THE SCHEDULING OF THE IRRIGATION SYSTEM TO MEET HORTICULTURAL REQUIREMENTS AND TO INSURE THAT EXCESSIVE SOIL SATURATION AND/OR SOIL EROSION DOES NOT OCCUR.

19. THE OWNER IS RESPONSIBLE FOR MAINTENANCE OF THE IRRIGATION SYSTEM.

20. IT IS THE OWNER'S RESPONSIBILITY TO INSPECT THE IRRIGATION SYSTEM PERIODICALLY TO INSURE THAT THE SYSTEM IS OPERATING EFFICIENTLY AND THAT ALL NECESSARY REPAIRS ARE MADE TO PROTECT THE HEALTH, SAFETY AND WELFARE OF THE PUBLIC.

system ANALYSIS

Generated:	2021-02-16 15:55

Critical Station Pressure at POC:	64.10 psi
Pressure Available:	85.00 psi
Residual Pressure Available:	20.90 psi

MINIMUM DESIGN CRITERIA

NEW LANDSCAPE WATER METER SIZE: 1 1/2", STATIC PRESSURE: 92 PSI, (MIN).

MINIMUM SYSTEM DESIGN CRITERIA IS BASED ON 82 P.S.I. USING 24 G.P.M.

CISTERN/PUMP SYS POC: 1 1/2", STATIC PRESSURE: 75 PSI, (MIN).

MINIMUM SYSTEM DESIGN CRITERIA IS BASED ON 65 P.S.I. USING 26 G.P.M.

CONTRACTOR SHALL VERIFY ALL POC SIZE, PRESSURE AND FLOW BEFORE INSTALLATION. IF INFORMATION CONFLICTS, NOTIFY THE OWNER FOR INFORMATION. FAILURE TO DO SO MAY RESULT IN CONTRACTOR BEING RESPONSIBLE FOR ANY CHANGES REQUIRED AS A RESULT.

GENERAL IRRIGATION NOTES:

PRESSURE REGULATING DEVICES ARE REQUIRED IF WATER PRESSURE IS BELOW OR EXCEEDS THE RECOMMENDED PRESSURE OF THE SPECIFIED DEVICES.

CHECK VALVES OR ANTI-DRAIN VALVES ARE REQUIRED ON ALL SPRINKLER HEADS WHERE LOW POINT DRAINAGE COULD OCCUR.

A DIAGRAM OF THE IRRIGATION PLAN SHOWING HYDROZONES SHALL BE KEPT WITH THE IRRIGATION CONTROLLER FOR SUBSEQUENT MANAGEMENT PURPOSES.

A CERTIFICATE OF COMPLETION SHALL BE FILLED OUT AND CERTIFIED BY EITHER THE DESIGNER OF THE LANDSCAPE PLANS, IRRIGATION PLANS, OR THE LICENSED LANDSCAPE CONTRACTOR FOR THE PROJECT.

AN IRRIGATION AUDIT REPORT SHALL BE COMPLETED AT THE TIME OF THE FINAL INSPECTION.

A MINIMUM 3-INCH LAYER OF MULCH SHALL BE APPLIED ON ALL EXPOSED SOIL SURFACES OF PLANTING AREAS EXCEPT TURF AREAS, CREEPING OR ROOTING GROUNDCOVERS, OR DIRECT SEEDING APPLICATIONS WHERE MULCH IS CONTRAINDICATED.

AT THE TIME OF FINAL INSPECTION, THE PERMIT APPLICANT MUST PROVIDE THE OWNER OF THE PROPERTY WITH A CERTIFICATE OF COMPLETION, CERTIFICATE OF INSTALLATION, IRRIGATION SCHEDULE OF LANDSCAPE AND IRRIGATION MAINTENANCE.

I HAVE COMPLIED WITH THE CRITERIA OF THE ORDINANCE AND APPLIED THEM FOR THE EFFICIENT USE OF WATER IN THE LANDSCAPE DESIGN PLANS.

UNLESS CONTRADICTED BY A SOILS TEST, COMPOST AT A RATE OF MINIMUM OF FOUR CUBIC YARDS PER 1,000 SQUARE FEET OF PERMEABLE AREA SHALL BE INCORPORATED TO A DEPTH OF SIX INCHES INTO THE SOIL.

A SOILS REPORT HAS NOT BEEN PROVIDED. THIS IRRIGATION DESIGN ASSUMES THE PROPERTY IS SITED ON LOAM SOILS. IF THIS IS NOT THE CASE, PLEASE CONTACT IRRIGATION DESIGNER IMMEDIATELY FOR REDESIGN.

CONTROL OF IRRIGATION WATER IS A NECESSARY PART OF SITE MAINTENANCE. SOGGY GROUND AND PERCHED WATER MAY RESULT IF IRRIGATION WATER IS EXCESSIVELY APPLIED. IRRIGATION SYSTEMS SHOULD BE ADJUSTED TO PROVIDE THE MINIMUM WATER NEEDED. ADJUSTMENTS SHOULD BE MADE FOR CHANGES IN CLIMATE AND RAINFALL.

SLEEVES ARE REQUIRED FOR ALL IRRIGATION PIPING INSTALLED UNDER OR THROUGH PAVING/RETAINING WALLS. REFER TO IRRIGATION SLEEVE SIZING CHART SHOWN ON THIS SHEET.
IT IS RESPONSIBILITY OF THE CONTRACTOR TO FAMILIARIZE HIM/HER SELF WITH ALL GRADE DIFFERENCES, LOCATION OF WALLS, RETAINING WALLS, FOOTINGS AND COORDINATE THIS WORK WITH OTHER TRADES.

IRRIGATION SLEEVE SIZES

PIPE SIZE	3/4"	1"	1-1/4"	1-1/2"	2"	2-1/2"	3"
SLEEVE SIZE	2"	2"	2-1/2"	3"	4"	5"	6"

NOTE: IRRIGATION CONTROL WIRE CONDUIT SIZE SHALL BE 4"

NO SCALE

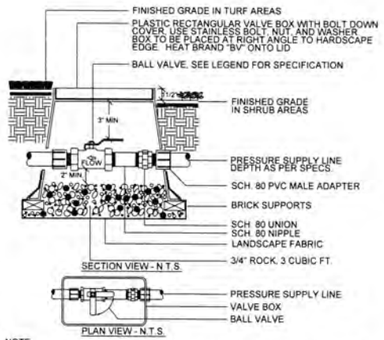
4 LOW VOLUME CONTROL ZONE ASSEMBLY
NO SCALE

NOTES: 1. CENTER BOXES OVER VALVES.
2. SET BOXES IN GROUND COVER/SHRUB AREA WHERE POSSIBLE.
3. SET BOXES PARALLEL TO EACH OTHER AND PERPENDICULAR TO EDGE.
4. AVOID HEAVILY COMPACTING SOIL AROUND BOXES TO PREVENT DAMAGING VALVE BOXES.

TOP VIEW

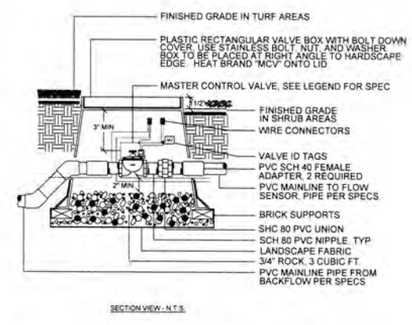


5 TYPICAL VALVE BOX LAYOUT
NO SCALE

SECTION VIEW - N.T.S.

NOTE:
- IF WYE STRAINER OR PRESSURE REGULATOR IS SPECIFIED, INSTALL ON EITHER THE HORIZONTAL PIPING OR ON THE DOWNSTREAM LEG AS SPACE PERMITS.
- ALL MATERIAL INSTALLED ABOVE GROUND SHALL BE PAINTED FRAZEE "BLACKSMITH" COLOR

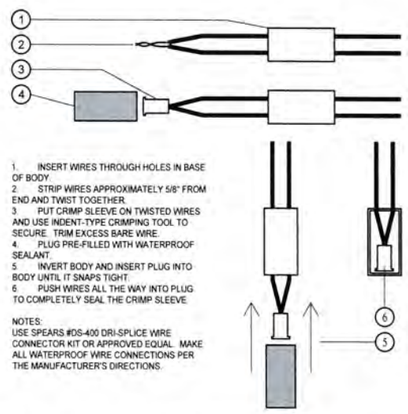
6 TYPICAL BACKFLOW PREVENTION ASSEMBLY
NO SCALE



SECTION VIEW - N.T.S.

PLAN VIEW - N.T.S.

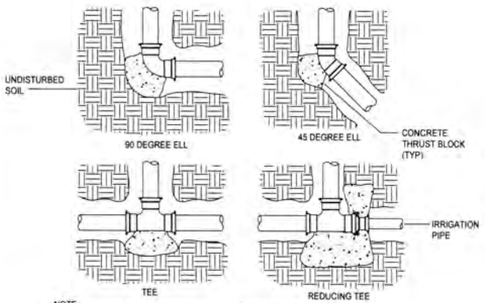
NOTE:
- BOX TO BE INSTALLED AS TO ALLOW FOR PROPER OPERATION OF BALL VALVE. INSTALL AT RIGHT ANGLE TO HARDSCAPE EDGE. INSTALL VALVE OFF-CENTER IN BOX.
- INSTALL VALVE BOX EXTENSIONS AS REQUIRED TO ACHIEVE PROPER VALVE INSTALLATION AT MAIN LINE DEPTH.



7 TYPICAL BALL VALVE ASSEMBLY
NO SCALE

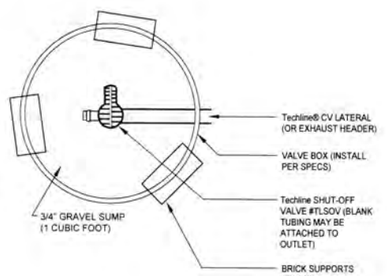
SECTION VIEW - N.T.S.

NOTE:
- INSTALL CONTROL VALVES A MINIMUM OF ONE FOOT APART IN SHRUB AREAS UNLESS OTHERWISE NOTED.
- USE 45 DEGREE ELLS TO ACHIEVE MAINLINE DEPTH FROM UP-STREAM SIDE OF THE MASTER VALVE ASSEMBLY.



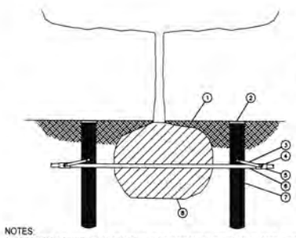
8 TYPICAL MASTER CONTROL VALVE ASSEMBLY
NO SCALE

1. INSERT WIRES THROUGH HOLES IN BASE OF BODY.
2. STRIP WIRES APPROXIMATELY 5/8" FROM END AND TWIST TOGETHER.
3. PUT CRIMP SLEEVE ON TWISTED WIRES AND USE INDENT-TYPE CRIMPING TOOL TO SECURE. TRIM EXCESS BARE WIRE.
4. PLUG PRE-FILLED WITH WATERPROOF SEALANT.
5. INVERT BODY AND INSERT PLUG INTO BODY UNTIL IT SNAPS TIGHT.
6. PUSH WIRES ALL THE WAY INTO PLUG TO COMPLETELY SEAL THE CRIMP SLEEVE.



NOTES:
USE SPEARS #DS-400 DRI-SPLICE WIRE CONNECTOR KIT OR APPROVED EQUAL. MAKE ALL WATERPROOF WIRE CONNECTIONS PER THE MANUFACTURER'S DIRECTIONS.

9 WIRE CONNECTION
NO SCALE



NOTE:
THRUST BLOCKS TO BE A MINIMUM OF 1 CUBIC FEET CONCRETE.
REFER TO MANUFACTURER RECOMMENDATIONS FOR CONFIGURATIONS NOT SHOWN PRIOR TO THRUST BLOCKING. WRAP FITTINGS USING AWWA C209 APPROVED TAPE

IRRIGATION DETAILS

L 5.29

LICENSED LANDSCAPE ARCHITECT Mark Sweatt 5608 Signature 4-30-2022 Renewal Date Date STATE OF CALIFORNIA

NOT FOR CONSTRUCTION

non-potable water sources as mentioned in these requirements shall not use purple pipe. Untreated stored rainfall/run-off should not be confused with tertiary treated wastewater, defined in Title 22 of the California Code of Regulations.

Urban run-off – refers to non-potable water from a dry weather run-off catchment system used for the collection of water run-off which does not necessarily come from a rain event.

POLICY: The Department shall review construction plans and operational practices for any proposed rainfall / non-potable cistern water capture and distribution system. The Department shall approve those systems which meet the Department Guidelines.

PROCEDURE: **PLAN REVIEW AND SUBMISSION**

1. Plans and specifications for the rain-fall/non-potable cistern water capture, distribution, use and operational practices shall be submitted for review and approval to the Department prior to implementation. The applicable Building & Safety Departments having jurisdiction shall also be notified for approval.
2. The Department will review the plans and operational practices to ensure safe re-use practices, correct labeling of pipelines and appropriate separation from potable water supplies and sanitary sewer lines, prior to approval.
3. Prior to commencing new or retrofit construction the contractor or installer shall contact the Department, to arrange for inspection of all on-site rain-fall/non-potable cistern water and potable water work. No excavation or open trench may be backfilled without first securing the Department approval. If any piping, rain-fall/non-potable cistern water or potable water, is installed prior to plan check approval and/or inspection, all or any portion of the system may be required to be exposed and corrected as necessary.
4. The rain-fall/non-potable cistern water system shall be constructed in conformance with potable water system construction standards and in accordance with all other governing codes, rules and regulations.
5. Unused or abandoned potable water lines are to be severed and capped as close to water mains as practical and a four-foot section of abandoned line removed. The cap shall be cemented under the Department's supervision.

REQUIRED SEPARATION OF LINES

In order to minimize construction accidents resulting in pipeline breaks, which may pollute the domestic water supply or accidental cross-connections between rain-fall/non-potable cistern water and potable water systems, maximum attainable separation of non-potable cistern water lines and potable water lines is required.

- Parallel Construction: There shall be at least a four foot (4') separation for all pressure mains, all distances measured from pipeline outside diameter. In restricted areas where 4 foot separations cannot be met, the use of sleeved pipe is required.

devices. They apply to onsite collection and re-use for the **same site only**. Offsite distribution of collected rainfall / non-potable cistern and urban run-off to other properties shall be evaluated by the California State Department of Public Health (CADPH) in conjunction with the California State Regional Water Quality Control Board (RWQCB).

DEFINITIONS:

Alternate Non-Potable Water Supply is a non-potable source of water which includes gray water, rainfall/run-off non-potable cistern water, urban run-off, on site treated water and recycled/reclaimed water.

Cistern (non-potable) refers to a receptacle or rainwater catchment system for storing water, usually underground, which captures non-potable water run-off for the purposes of reusing the water for irrigation purposes. Non-potable cisterns are distinct from Potable Cisterns that are installed and managed as potable water reservoirs/storage.

Gray water refers to untreated waste water which has not come into contact with toilet waste. Gray water includes used water from bathtubs, showers, bathroom wash basins, clothes washing machines and laundry. It does not include waste water from kitchen sinks, photo lab sinks, dishwashers or laundry water from soiled diapers.

Non-Potable Water refers to water which is not intended for human consumption. Two distinct variations are inclusive in this definition: Non-potable water from a potable source, via a dedicated backflow prevention device vs. untreated non-potable water from collection methods that never originated from a potable source. The term non-potable water is all-inclusive with respect to the various non-potable water supplies mentioned within these requirements.

Onsite Water Supervisor refers to that person appointed at each location proposing to install a non-potable water cistern, as provided for under Title 17, Section 7586, California Code of Regulations who is responsible for the protection of the potable water system from cross connections. This person is responsible for installation, operation, maintenance of the rain-fall / non-potable cistern water and potable water systems, prevention of potential hazards, implementation of these requirements, and coordination with the Department.

Potable Water refers to water which is fit for consumption by humans and other animals. The U.S. Environmental Protection Agency (EPA) identifies contaminants that may adversely affect public health that occur in drinking water with a frequency and at levels that pose a threat to public health. The EPA establishes maximum contaminant levels (MCLs) (both biological and chemical) permissible in drinking water. These MCLs become enforceable standards.

Rain-fall/ Non-potable Cistern Water refers to the harvested rainwater/storm water collected within a cistern from a rain event and/or urban run-off. Cisterns in Los Angeles County may serve as a secondary source of water for applications that do not require potable water, such as landscape irrigation, which can dramatically lower the potable water demand and reducing off-site rain-fall runoff.

Recycled Water / Reclaimed Water refers to tertiary-treated water produced from the three-stage treatment of municipal wastewater. Recycled water is allowable for full-body human contact but not for direct human consumption. Purple pipe is the designated pipeline material specifically allowed to convey tertiary treated recycled water. Other

POLICY AND OPERATIONS MANUAL

SUBJECT:	APPROVAL AND USE OF CISTERNS FOR RAINFALL / RUN-OFF CAPTURE AND DISTRIBUTION		
POLICY NO.:	515.07	**EFFECTIVE DATE:**	DECEMBER 15, 2009
APPROVED BY:		**SUPERCEDES:**	NEW

PROGRAM AFFECTED: CROSS CONNECTION AND WATER POLLUTION CONTROL, DRINKING WATER AND LAND USE PROGRAMS

PURPOSE: To establish standardized procedures for the review and approval of plans and specifications for rainfall / non-potable cistern water capture and distribution systems. Additionally, this policy is intended to provide guidelines for the approved use and operational practices for any proposed system prior to implementation.

These requirements will provide the necessary procedures to acquire approval for the installation of pipeline which will convey untreated rain-fall, non-potable cistern water and / or urban run-off water for **irrigation purposes only**. Moreover, it is intended to establish requirements for the protection of the potable domestic water supply as well as that of public health.

Treatment systems for rain, gray and urban run-off water for re-use in toilet flushing have been proposed but are not covered within these requirements.

BACKGROUND: Rain barrels and cisterns are methods of storing rainfall and runoff on-site for landscape irrigation purposes. In semi-arid Los Angeles County, captured rainfall / runoff are valuable resources that could reduce the amount of water that must be imported for domestic use. For this reason, there should be no impediment to storing and reusing rainfall and run-off as long as it can be done safely with adequate protection of public health.

Presently within Los Angeles County, there are no regulatory definitions of rainfall, non-potable cistern water or urban run-off that would categorize them as either recycled water or any other regulated water source. These types of non-potable water sources are categorized within the scope of "alternate non-potable water supplies". Therefore rainfall / run-off, non-potable cistern and urban run-off water, for the purposes of these requirements shall be recognized by the Los Angeles County Department of Public Health – Environmental Health (the Department) (pending adoption of proposed regulation) as "alternate non-potable water supply sources". Those regulations pertaining to the protection of the domestic water supply in relation to an "alternate non-potable water supply source" shall apply.

These requirements are intended to focus on projects which integrate below-grade pipelines, pumps and large capacity holding tanks but not necessarily rain barrels that collect rainfall / run-off water from residential rooftops, gravity-fed and / or hand-held

- Cross-Over Construction: Perpendicular pipeline installation is set at a one foot (1') separation, with potable water pipes above rain-fall/non-potable cistern water pipes, and one full pipe length centered over crossing.
- Alternative Cross-Over construction (distance not maintained): Either the rain-fall/non-potable cistern water may be sleeved with the same class piping (usually schedule 40 PVC) for one full pipe length (minimum four feet) centered over the cross-over.

Existing On-site piping – To the extent feasible, maximum separation of rain-fall/non-potable cistern water lines and potable water lines shall be practiced upon system addition or modification.

IDENTIFICATION OF LINES

All rainfall/non-potable cistern water main lines, valve boxes and appurtenances shall be identified to clearly distinguish between non-potable cistern water and potable water systems. Specific wording on identification tape shall be required. Evaluation shall be on a case-by-case basis, but with the understanding that the minimum requirement for pipeline identification is per the Uniform Plumbing Code. The following identification tape will be accompanied with respective tags of the same colors and wording for all valve boxes, vaults, control valves, quick couplers, outlets and related appurtenances, if applicable.

a. ***POTABLE WATER*** – All potable water lines are required to be installed in accordance with the Uniform Plumbing Code and all other governing codes, rules and regulations. Buried potable water lines shall be identified by continuous tape with lettering on three inch (3") minimum width green or blue tape with one inch black lettering bearing the continuous wording **"Potable Water"**. Identification tape shall be permanently affixed to the pipeline at five foot intervals atop all horizontal piping, laterals and mains. Identification tape shall extend to all valve boxes and/or vaults, exposed piping and hydrants. Identification tape is not necessary for extruded colored PVC with continuous wording **"Potable Water"** printed in contrasting lettering on opposite sides of the pipe.

b. ***RAIN-FALL/NON-POTABLE CISTERN WATER*** – All rain-fall/non-potable cistern water lines (pressure/non-pressure) shall be identified by continuous lettering on three inch (3") minimum width YELLOW tape with one inch black lettering bearing the continuous wording **"Caution – Non-Potable Cistern Water, Subsurface Irrigation Only"** permanently affixed at five foot intervals atop all horizontal piping, laterals and mains. Identification tape shall extend to all valve boxes and/or vaults and exposed piping.

c. ***NON-POTABLE WATER*** – All non-potable irrigation/industrial water lines (pressure/non-pressure) shall be identified by continuous lettering on three inch (3") minimum width yellow tape with one inch black lettering bearing the continuous wording **"Non-Potable Water"** permanently affixed at five foot intervals atop all piping. Identification tape shall extend to all valve boxes and/or vaults, exposed piping, hydrants and quick couplers.

d. Tags, respective of each water supply, shall be identified with the appropriate wording on both sides with the inclusion of a universal symbol.

OPERATIONAL GUIDELINES AND SPECIFICATIONS

1. Irrigation systems utilizing untreated rain-fall/non-potable cistern water shall only be by means of "subsurface irrigation. Misting or spraying into the air is prohibited. Irrigation practices shall be controlled to prevent surface runoff from lands owned or controlled by the user. **(" Above grade spray irrigation would necessitate additional treatment to ensure the removal of pathogens. Please contact the Department for more information).**
2. Any pipeline other than potable water that is installed within a structure shall conform to all building code standards and shall be "barber shop" wrapped with the respective continuous identification tape and without any interconnections with the potable water system.
3. Gray water systems, rain-fall/runoff non-potable cistern systems and recycled water systems are not to be interconnected. Each shall be installed as stand alone systems completely separate from one another. Gray water systems are directly connected to the sewage system. Rain-fall/non-potable cisterns are not to be directly connected to a sewer system. For gray water installation requirements refer to California Plumbing Code 2007, Chapter 16/Appendix G (DWR).
4. Cisterns/storage vessels shall be adequately covered to prevent mosquito breeding. Contact the local Mosquito Abatement District for clarification.
5. Contact with untreated rainfall/non-potable cistern water should be kept to a minimum.
6. Deteriorated or inadequately protected water well casings shall be protected against contamination by untreated rain-fall/non-potable cistern water by correcting these physical deficiencies. Surface infiltration of untreated rainfall/runoff is allowed provided it occurs at least 10 feet from an unprotected foundation structure; when there is a least 10 feet of clearance to the seasonal high ground water table; and when it occurs at least 100 feet from a water supply well.
7. An **On-Site Water Supervisor** shall be appointed as provided for under Title 17, Section 7586, California Code of Regulations. Authorizations for any piping changes or additions to either the potable or recycled wastewater systems shall be subject to review and approval by the water supervisor. The name and position of this individual shall be reported to the water purveyor and to the Department.
8. As-built plans shall be prepared and updated as necessary by the user showing the location of rain-fall/non-potable cistern water and potable water system piping.
9. To prevent secondary exposure to rain-fall/non-potable cistern water, hose bibbs and quick couplers shall not be permitted in order to prevent both the unauthorized use of the non-potable water supply and secondary exposure to untreated non-potable water supply.
10. A potable water source may be connected via an approved backflow prevention device to provide a back up water source to a non-potable water cistern. A non-

potable water backup supply line from a potable source via an approved backflow prevention device **can** be directly connected to the rain-fall/non-potable cistern discharge line to the irrigation system. Gray water systems **cannot** be directly connected to a potable supply with or without a backflow prevention device, (air gaps are excluded) (2007 California Plumbing Code, Section 603.3.5). Air gaps are the only method that may be utilized when potable water is used as a make-up source to a gray water system due to the required sewer connection.

11. A pressure test/cross-connection test shall be performed to confirm the physical separation of the cistern water and potable water systems. Said testing shall be performed in conjunction with the Water Purveyor and this Department and conducted before the introduction of rainfall/non-potable cistern water.
12. The Department shall refer all plans proposing to install a cistern to the following agencies prior to construction:
    - Los Angeles County Cross-Connection & Water Pollution Control Program to: initiate the plan proposal; conditional approval; interim construction inspections and final approval.
    - The City or County Building & Safety Department for construction permits and inspections (Building Codes).
    - The local water purveyor regarding required backflow protection at the potable/city water service connection(s).
    - The Mosquito Abatement District for conditions of approval and to register the cistern tank.
    - The City or County Public Works Department for cistern tank overflow discharge requirements.

CITY OF MALIBU GRADING NOTES

1. ANY MODIFICATIONS OF OR CHANGES IN APPROVED GRADING PLANS MUST BE APPROVED BY THE BUILDING OFFICIAL.
2. A COPY OF THE GRADING PERMIT AND APPROVED GRADING PLAN MUST BE IN THE POSSESSION OF A RESPONSIBLE PERSON AND AVAILABLE AT THE SITE.
3. ENGINEER MUST SET GRADE STAKES FOR ALL DRAINAGE DEVICES AND OBTAIN INSPECTION APPROVAL BEFORE POURING.
4. PROVISIONS WILL BE MADE FOR CONTRIBUTORY DRAINAGE AT ALL TIMES.
5. SECURE PERMISSION FROM CITY ENGINEER, EASEMENT GRANTEE, STATE HIGHWAY DEPARTMENT, AND/OR HOMEOWNERS ASSOCIATION FOR CONSTRUCTION, GRADING, AND/OR DISCHARGE OF DRAINAGE WITHIN STREET RIGHT-OF-WAY.
6. GRADING SHALL NOT BE STARTED WITHOUT FIRST NOTIFYING THE GRADING INSPECTOR. A PRE-GRADING MEETING ON THE SITE IS REQUIRED BEFORE START OF GRADING WITH THE FOLLOWING PEOPLE PRESENT: OWNER, GRADING CONTRACTOR, DESIGN CIVIL ENGINEER, SOIL ENGINEER, GEOLOGIST, GRADING INSPECTOR, AND, WHEN REQUIRED, THE ARCHAEOLOGIST AND PALEONTOLOGIST. THE REQUIRED INSPECTIONS FOR GRADING WILL BE EXPLAINED AT THIS MEETING.
7. CUT AND FILL SLOPES SHALL BE NO STEEPER THAN 3' HORIZONTAL TO 1' VERTICAL (3:1), EXCEPT WHERE SPECIFICALLY APPROVED OTHERWISE.
8. AREAS TO RECEIVE FILL SHALL BE PROPERLY PREPARED AND APPROVED, IN WRITING, BY THE SOIL ENGINEER AND THE BUILDING OFFICIAL PRIOR TO PLACING FILL.
9. FILL SHALL BE BENCHED INTO COMPETENT MATERIAL PER CITY OF MALIBU STANDARD OR SOIL ENGINEER'S DIRECTION.
10. ALL EXISTING FILLS SHALL BE APPROVED BY THE BUILDING OFFICIAL OR REMOVED PRIOR TO PLACING ADDITIONAL FILLS.
11. ANY EXISTING IRRIGATION LINES AND CISTERNS SHALL BE REMOVED OR CRUSHED, IN PLACE, AND APPROVED BY THE BUILDING OFFICIAL AND SOIL ENGINEER.
12. STOCKPILING OF EXCESS MATERIAL SHALL BE APPROVED BY THE BUILDING OFFICIAL PRIOR TO EXCAVATION.
13. THE DESIGN ENGINEER, AS A CONDITION OF ROUGH GRADE APPROVAL, SHALL PROVIDE A BLUE TOP WITH ACCOMPANYING WITNESS STAKE, SET AT THE CENTER OF EACH PAD REFLECTING THE PAD ELEVATION FOR PRECISE PERMITS AND A BLUE TOP WITH WITNESS STAKE SET AT THE DRAINAGE SWALE HIGH POINT REFLECTING THE HIGH POINT ELEVATION FOR PRELIMINARY PERMITS.
14. ALL TRENCH BACKFILLS SHALL BE TESTED AND APPROVED BY THE SOILS ENGINEER.
15. SUBDRAIN OUTLETS SHALL BE COMPETED AT THE BEGINNING OF THE SUBDRAIN CONSTRUCTION AND SURVEY FOR LOCATION. THE AS GRADED PLAN SHALL SHOW ALL SUBDRAIN LOCATIONS AND ELEVATIONS.
16. SUBDRAIN OUTLETS SHALL BE COMPLETED AT THE BEGINNING OF THE SUBDRAIN CONSTRUCTION.
17. THE EXACT LOCATION OF THE SUBDRAINS SHALL BE SURVEYED IN THE FIELD FOR LINE/GRADE AND REFLECTED ON AS-GRADED PLANS. CONTINUOUS INSPECTION BY THE SOILS ENGINEER OR HIS RESPONSIBLE REPRESENTATIVE SHALL BE PROVIDED DURING ALL SUBDRAIN INSTALLATIONS OR WHEREVER DETERMINED TO BE NECESSARY BY THE BUILDING OFFICIAL.
18. ALL CUT SLOPES SHALL BE INVESTIGATED BOTH DURING AND AFTER GRADING BY THE ENGINEERING GEOLOGIST TO DETERMINE IF ANY SLOPE STABILITY PROBLEM EXISTS. SHOULD EXCAVATION DISCLOSE ANY GEOLOGIC CONDITIONS OR POTENTIAL GEOLOGICAL HAZARDS, THE ENGINEERING GEOLOGIST SHALL SUBMIT RECOMMENDED REMEDIATION TO THE BUILDING OFFICIAL FOR APPROVAL.
19. WHERE SUPPORT OR BUTTRESSING OF CUT AND NATURAL SLOPES IS DETERMINED TO BE NECESSARY BY THE ENGINEERING GEOLOGIST AND SOILS ENGINEER, THE SOILS ENGINEER SHALL SUBMIT DESIGN, LOCATIONS, AND CALCULATIONS TO THE BUILDING OFFICIAL PRIOR TO CONSTRUCTION. THE ENGINEERING GEOLOGIST AND SOILS ENGINEER SHALL INSPECT AND CONTROL THE CONSTRUCTION OF THE BUTTRESSING AND CERTIFY TO THE STABILITY OF THE SLOPE AND ADJACENT STRUCTURES UPON COMPLETION.
20. WHEN CUT PADS ARE BROUGHT TO NEAR GRADE, THE ENGINEERING GEOLOGIST SHALL DETERMINE IF THE BEDROCK IS EXTENSIVELY FRACTURED OR FAULTED AND WILL READILY TRANSMIT WATER. IF CONSIDERED NECESSARY BY THE ENGINEERING GEOLOGIST AND SOIL ENGINEER, A COMPACTED FILL BLANKET WILL BE PLACED.
21. THE ENGINEERING GEOLOGIST SHALL PERFORM PERIODIC INSPECTIONS AND SUBMIT A COMPLETE REPORT AND MAP UPON COMPLETION OF THE ROUGH GRADING.
22. THE COMPACTION REPORT AND APPROVAL FROM THE SOILS ENGINEER SHALL INDICATE THE TYPE OF FIELD TESTING PERFORMED, EACH TEST SHALL BE IDENTIFIED WITH THE METHOD OF OBTAINING THE IN-PLACE DENSITY; WHETHER SAND CONE OR NUCLEAR GAUGE, AND SHALL BE SO NOTED FOR EACH TEST.
23. THE GRADING CONTRACTOR SHALL SUBMIT A WRITTEN STATEMENT VERIFYING THAT THE WORK DONE UNDER HIS DIRECTION WAS PERFORMED IN ACCORDANCE WITH THE APPROVED PLANS AND REQUIREMENTS OF CHAPTER 33 OF THE MALIBU BUILDING CODE OR DESCRIBING ALL VARIANCES FROM THE APPROVED PLANS AND REQUIREMENTS OF THE CODE. [3318.1]
24. THE DESIGN ENGINEER VERIFIES THAT THIS GRADING PLAN WAS PREPARED UNDER MY SUPERVISION IN ACCORDANCE WITH SECTION 3318.1 OF THE MALIBU BUILDING CODE. ALL SOILS ENGINEERING AND ENGINEERING GEOLOGY RECOMMENDATIONS WERE INCORPORATED IN THE PLAN. (MUST BE SIGNED AND DATED BY THE DESIGN ENGINEER.)
25. GRADING OPERATIONS MUST BE CONDUCTED UNDER PERIODIC GEOLOGIC INSPECTION WITH INSPECTION REPORTS TO BE SUBMITTED TO THE BUILDING DEPARTMENT.
26. EXPORT SOIL MUST BE TRANSPORTED TO A LEGAL DUMP OR TO A PERMITTED SITE SHOWN CLEARLY ON APPROVED PLANS.
27. SLOPES SHALL BE PLANTED WITH AN APPROVED PLANT MATERIAL AND PROVIDED WITH AN APPROVED IRRIGATION SYSTEM, UNLESS AN ALTERNATIVE HAS BEEN APPROVED BY THE CITY BIOLOGIST.
28. THE ENGINEER SHALL SUBMIT A LETTER OF CERTIFICATION TO THE BUILDING OFFICIAL STATING THAT THE GRADING WAS DONE IN COMPLIANCE WITH THE APPROVED GRADING PLAN.
29. PRELIMINARY SOIL AND GEOLOGY REPORTS AND ALL SUBSEQUENT REPORTS, AS APPROVED BY THE CITY OF MALIBU, ARE CONSIDERED A PART OF THE APPROVED GRADING PLAN. ALL RECOMMENDATIONS CONTAINED ARE TO BE COMPLIED WITH, OR REVISIONS SUBMITTED FOR REVIEW.
30. ALL EXISTING DRAINAGE COURSES THROUGH THIS SITE SHALL REMAIN OPEN UNTIL FACILITIES TO HANDLE STORM WATER ARE APPROVED AND FUNCTIONAL; HOWEVER, IN ANY CASE, THE PERMITEE SHALL BE HELD LIABLE FOR ANY DAMAGE DUE TO OBSTRUCTING NATURAL DRAINAGE PATTERNS.
31. GRADING OPERATIONS, INCLUDING MAINTENANCE OF EQUIPMENT, SHALL BE ACCOMPLISHED WITHIN THE CONFINES OF THE NOISE ORDINANCE AND POLICIES OF THE CITY OF MALIBU.
32. ROOF GUTTERS SHALL BE INSTALLED TO PREVENT ROOF DRAINAGE FROM FALLING ON MANUFACTURED SLOPES. GUTTERS SHALL BE CONNECTED TO NON-EROSIVE PIPING OR ANOTHER METHOD ACCEPTABLE TO THE BUILDING OFFICIAL.
33. ANY EXCAVATIONS ADJACENT TO OTHER PROPERTY OR STRUCTURES ARE SUBJECT TO THE PROVISIONS OF CALIFORNIA CIVIL CODE, SECTION 832, AND IS THE RESPONSIBILITY OF THE PERMITTEE AND/OR THE OWNER.

PLANTING AND IRRIGATION NOTES

34. ALL CUT AND FILL SLOPES WILL BE PLANTED WITH AN APPROVED GROUND COVER AND PROVIDED WITH AN IRRIGATION SYSTEM AS SOON AS IS PRACTICAL DURING GRADING. IN ADDITION TO THE GROUND COVER PLANTS SHALL BE INSTALLED ON ALL SLOPES. ALL PLANTING SHALL BE OF A TYPE APPROVED BY THE CITY BIOLOGIST.
35. THE PLANS FOR A DESIGNED IRRIGATION SYSTEM FOR FULL COVERAGE OF ALL PORTIONS OF THE SLOPES SHALL BE SUBMITTED AND APPROVED PRIOR TO ROUGH GRADING APPROVAL BY THE CITY BIOLOGIST.
36. PLANTING AND IRRIGATION PLANS FOR SLOPES MUST BE PREPARED AND SIGNED BY A CIVIL ENGINEER OR LANDSCAPE ARCHITECT.
37. FINISH GRADING WILL BE COMPLETED AND APPROVED AND SLOPE PLANTING IRRIGATION SYSTEMS INSTALLED BEFORE OCCUPANCY OF BUILDINGS.

FILL NOTES

38. THE PERMITTEE OR HIS AGENT SHALL NOTIFY THE BUILDING OFFICIAL 24 HOURS BEFORE THE GRADING OPERATION IS READY FOR EACH OF THE FOLLOWING INSPECTIONS: (THE PERMITTEE NEED NOT WAIT FOR THE INSPECTOR TO ARRIVE BEFORE PROCEEDING WITH THE WORK).
39. FILL SHALL BE COMPACTED (AS DETERMINED BY A.S.T.M. SOIL COMPACTION TEST D1557-LATEST VERSION) THROUGHOUT THEIR FULL EXTENT TO [3313.4]:
    A. A MINIMUM RELATIVE COMPACTION OF 90% OF MAXIMUM DRY DENSITY WITHIN 40 ft. BELOW FINISH GRAD, AND
    B. 93% OF MAXIMUM DRY DENSITY DEEPER THAN 40 ft. BELOW FINISH GRADE.
40. FIELD DENSITY SHALL BE DETERMINED BY SAND-CONE METHOD, A.S.T.M. D1557-LATEST VERSION. IN FINE-GRAINED COHESIVE SOILS FIELD DENSITY SHALL BE DETERMINED BY THE DRIVE-CYLINDER METHOD, A.S.T.M. D-2937-LATEST VERSION, PROVIDED NOT LESS THAN 20% OF THE REQUIRED DENSITY SHALL BE SHOWN IN THE COMPACTION REPORT. OTHER METHODS MAY BE USED IF RECOMMENDED BY THE SOILS ENGINEER AND APPROVED IN ADVANCE BY THE BUILDING OFFICIAL. [3310.4]
41. SUFFICIENT TESTS OF SOIL PROPERTIES, INCLUDING SOIL TYPES AND SHEAR STRENGTH, SHALL BE MADE DURING GRADING OPERATIONS TO VERIFY COMPLIANCE WITH DESIGN CRITERIA. THE RESULTS OF SUCH TESTING SHALL BE FURNISHED TO THE BUILDING OFFICIAL UPON COMPLETION OF GRADING OPERATIONS, OR WHEN NECESSITATED BY FIELD CONDITIONS UPON REQUEST OF THE BUILDING OFFICIAL. [331.8] ONE FIELD DENSITY TEST TO BE MADE AS FOLLOWS:
    a. ONE TEST FOR EACH TWO FOOT VERTICAL LIFT.
    b. ONE TEST FOR EACH 1,000 CUBIC YARDS OF MATERIAL PLACED.
    c. ONE TEST WILL BE MADE AT POINT APPROXIMATELY ONE FOOT BELOW THE FILL SLOPE SURFACE ON THE BASIS OF ONE TEST FOR EACH 1,000 SQUARE FEET OF SLOPE SURFACE BUT NOT LESS THAN ONE TEST FOR EACH 10 FOOT OF VERTICAL SLOPE HEIGHT.
42. NO FILL SHALL BE PLACED UNTIL STRIPPING OF VEGETATION, REMOVAL OF UNSUITABLE SOILS, AND INSTALLATION OF SUBDRAINS (IF ANY) HAVE BEEN INSPECTED AND APPROVED BY SOILS ENGINEER.
43. NO ROCK OR SIMILAR MATERIAL GREATER THAN 12" IN DIAMETER WILL BE PLACED IN THE FILL UNLESS RECOMMENDATIONS FOR SUCH PLACEMENT HAVE BEEN SUBMITTED BY THE SOILS ENGINEER AND APPROVED, IN ADVANCE, BY THE BUILDING OFFICIAL.
44. CONTINUOUS INSPECTION BY THE SOILS ENGINEER OR HIS RESPONSIBLE REPRESENTATIVE SHALL BE PROVIDED DURING ALL SUBDRAIN INSTALLATIONS OR WHEREVER DETERMINED TO BE NECESSARY BY THE BUILDING OFFICIAL.
45. ORIGINAL OF ALL REPORTS SHALL BE PROVIDED TO THE BUILDING OFFICIAL FOR ALL COMPACTED FILLS.
46. ALL CONCRETE PLACED ON GRADE SHALL BE COLORED TO MATCH NATURAL CONDITIONS ADJACENT TO THE STRUCTURES. SURFACE PAINT IS NOT ACCEPTABLE. ALL COLORS ARE TO BE INCORPORATED INTO THE MIX AND BLENDED UNIFORMLY.
47. FILL PLACED OVER EXISTING TERRAIN 5:1 AND STEEPER THAN 3' HORIZONTAL TO 1' VERTICAL (3:1) EXCEPT WHERE SPECIFICALLY APPROVED OTHERWISE.
48. FILL SHALL BE COMPACTED THROUGHOUT TO A MINIMUM OF 90% RELATIVE COMPACTION, AGGREGATE BASE FOR ASPHALTIC AREAS SHALL BE COMPACTED TO A MINIMUM OF 95% RELATIVE COMPACTION, TEST D1557-91T OR APPROVED EQUIVALENT. ORIGINALS OF ALL REPORTS SHALL BE PROVIDED TO THE BUILDING OFFICIAL.

GRADING INSPECTION REQUIREMENTS

49. THE PERMITTEE OR HIS AGENT SHALL NOTIFY THE BUILDING OFFICIAL 24 HOURS BEFORE THE GRADING OPERATION IS READY FOR EACH OF THE INSPECTIONS. (THE PERMITTEE NEED NOT WAIT FOR THE INSPECTOR TO ARRIVE BEFORE PROCEEDING WITH WORK)
    a. INITIAL INSPECTION: WHEN THE SITE HAS BEEN CLEARED OF VEGETATION AND UNAPPROVED FILL AND IT HAS BEEN SCARIFIED, BENCHED OR OTHERWISE PREPARED FOR FILL. NO FILL SHALL HAVE BEEN PLACED PRIOR TO INSPECTION.
    b. TOE INSPECTION: AFTER THE NATURAL GROUND IS EXPOSED AND PREPARED TO RECEIVE FILL AND BEFORE ANY FILL IS PLACED.
    c. EXCAVATION INSPECTION: AFTER THE EXCAVATION IS STARTED AND BEFORE THE DEPTH OF EXCAVATION EXCEEDS 10 FEET.
    d. ROUGH INSPECTION: WHEN APPROXIMATE FINAL ELEVATIONS HAVE BEEN ESTABLISHED; DRAINAGE TERRACE, SWALES AND OTHER DRAINAGE DEVICES NECESSARY FOR THE PROTECTION OF THE BUILDING FROM FLOODING ARE INSTALLED; BERMS INSTALLED AT THE TOP OF SLOPES; SUBMIT THE REQUIRED "ROUGH GRADING RECORDS" FOUNDATIONS SHALL NOT BE EXCAVATED UNTIL THE BUILDING OFFICIAL HAS APPROVED ROUGH GRADING.
    e. FINAL INSPECTION: WHEN GRADING HAS BEEN COMPLETED, ALL DRAINAGE DEVICES NECESSARY TO DRAIN THE BUILDING PAD ARE INSTALLED, SLOPE PLANTING ESTABLISHED AND ALL IRRIGATION SYSTEM INSTALLED. SUBMIT THE REQUIRED "AS-BUILT GRADING PLAN" AND "NOTIFICATION OF COMPLETION".
    f. SUBDRAIN INSTALLATION: PROVIDE CONTINUOUS INSPECTION DURING SUBDRAIN EXCAVATION AND INSTALLATION. CONTINUOUS INSPECTION BY THE SOILS ENGINEER OR HIS RESPONSIBLE REPRESENTATIVE SHALL BE PROVIDED DURING ALL SUBDRAIN INSTALLATIONS. [3313.2]
    g. FILL INSTALLATION:
        i. AFTER THE FILL EMPLACEMENT IS STARTED AND BEFORE THE VERTICAL HEIGHT OF THE LIFTS EXCEEDS 10ft. [3313.2]
        ii. DURING PREPARATION OF NATURAL GROUND AND PLACEMENT AND COMPACTION FILL.
        iii. THE SOILS ENGINEER SHALL BE PRESENT DURING THE ENTIRE FILL PLACEMENT AND COMPACTION OF FILLS THE WILL EXCEED A VERTICAL HEIGHT OR DEPTH OF 30ft> OR RESULTS IN A SLOPE SURFACE STEEPER THE 2 HORIZONTAL 1 VERTICAL. [3313.7]
    h. DRAINAGE DEVICE INSPECTION: AFTER FORMS AND PIPES ARE IN PLACE AND BEFORE ANY CONCRETE IS POURED
    i. ROUGH GRADING: WHEN ALL ROUGH GRADING HAS BEEN COMPLETED AND EROSION PROTECTION HAS BEEN INSTALLED. THE GEOTECHNICAL ENGINEER SHALL SUBMIT THE FINAL COMPACTION REPORT PRIOR TO THE APPROVAL OF ROUGH GRADE.

GRADING PLAN NOTES:

50. THE CONTRACTOR SHALL VERIFY ALL EXISTING TOPOGRAPHY AND GRADES PRIOR TO GRADING. IT SHALL BE THE CONTRACTORS RESPONSIBILITY TO NOTIFY THE PROJECT CIVIL ENGINEER OF ANY DISCREPANCIES OR REQUIRED DESIGN CHANGES SO THE APPROPRIATE CHANGES CAN BE MADE.
51. THE CONTRACTOR SHALL ENSURE THAT ALL UTILITIES AND EASEMENTS ARE ADEQUATELY STAKED PRIOR TO ANY GRADING.
52. THE CONTRACTOR SHALL BE RESPONSIBLE FOR ALL UNDERGROUND UTILITIES. UNDERGROUND ALERT SHALL BE NOTIFIED A MINIMUM OF 48 HOURS PRIOR TO DIGGING.
53. THE APPROVED GEOLOGY AND GEOTECHNICAL REPORTS SHALL BE CONSIDERED A PART OF THESE PLANS. COPIES OF THESE REPORTS SHOULD BE MAINTAINED ON SITE DURING SITE DEVELOPMENT.
54. THE PROJECT CIVIL ENGINEER SHALL BE NOTIFIED AND APPROVE ANY DESIGN CHANGES PRIOR TO IMPLEMENTATION DURING SITE DEVELOPMENT.
55. ALL RETAINING WALLS ARE UNDER SEPARATE PERMIT. PRIOR TO IMPLEMENTATION DURING SITE DEVELOPMENT.
56. SOIL COMPACTION REPORT SHALL BE PROVIDED TO THE BUILDING INSPECTOR AT THE JOB SITE PRIOR TO PLACEMENT OF CONCRETE FOR THE FOUNDATION.
57. SOIL ENGINEER SHALL INSPECT FOUNDATION PRIOR TO PLACEMENT OF CONCRETE FOR THE FOUNDATION.

ADDITIONAL NOTES:

58. EXPANSION INDEX TESTING SHOULD BE PERFORMED DURING SITE PREPARATION TO VERIFY AS-GRADED SITE CONDITIONS. THE RESULTS OF THE TESTS AS WELL AS SPECIFIC RECOMMENDATIONS FOR SLAB REINFORCEMENT AND THICKNESS MUST BE SUBMITTED TO THE CITY FOR REVIEW AT THAT TIME.
59. AN EVALUATION OF SOIL CORROSIVITY SHALL BE MADE IN ACCORDANCE WITH SECTION 6.2.1 OF THE CITY OF MALIBU'S GEOTECHNICAL GUIDELINES AT THE COMPLETION OF GRADING BY THE PROJECT GEOTECHNICAL CONSULTANT, WHO SHALL PROVIDE APPROPRIATE RECOMMENDATIONS.
60. PRIOR TO FINAL APPROVAL OF THE PROJECT AN AS-BUILT COMPACTION REPORT PREPARED BY THE PROJECT CONSULTANT MUST BE SUBMITTED TO THE CITY FOR REVIEW. THE REPORT MUST INCLUDE THE RESULTS OF ALL DENSITY TESTS AS WELL AS A MAP DEPICTING THE LIMITS OF FILL LOCATIONS OF ALL DENSITY TESTS, LOCATIONS OF ELEVATIONS OF KEYWAYS AND BACKDRAINS, LOCATIONS AND ELEVATION OF ALL REMOVAL BOTTOMS (INCLUDING THE RESULTS OF ALL TESTING PERFORMED TO VERIFY COMPETENT BOTTOMS) AND LOCATIONS AND ELEVATIONS OF ALL RETAINING WALL BACKDRAINS AND OUTLETS. GEOLOGIC CONDITIONS EXPOSED DURING GRADING MUST BE DEPICTED ON AN AS-BUILT GEOLOGIC MAP.
61. THE SURFACE OF THE CUT SHALL BE NO STEEPER THAN 3 HORIZONTAL TO 1 VERTICAL (33% SLOPE) UNLESS A SOILS ENGINEER OR AN ENGINEERING GEOLOGY REPORT STATING THAT A CUT AT A STEEPER SLOPE WILL BE STABLE AND NOT CRATE A HAZARD. PROVIDE A RECOMMENDATION FROM THE PROJECT GEOTECHNICAL ENGINEER, GEOLOGIST AND APPROVED BY THE CITY SOILS AND GEOLOGY STAFF. [3312.2].
62. THE EXPORT OF CUT MATERIAL MAY BE REQUIRED TO PRESERVE THE NATURAL TOPOGRAPHY OF THE PROJECT SITE. [MLCP 8.3B, 2] ADD THE FOLLOWING NOTE ON THE PLANS: "CUT MATERIAL MAY ONLY BE EXPORTED TO AN APPROXIMATE LANDFILL OR A SITE PERMITTED TO ACCEPT MATERIAL."
63. MAXIMUM GRADE OF CUT OR FILL [MLCP 8.3D:
    a. 3:1 FOR AREAS CRATED FOR DEVELOPMENT OF STRUCTURES AND OPEN YARD AREAS.
64. THE FACES OF CUT AND FILL SLOPES SHALL BE PREPARED AND MAINTAINED TO CONTROL EROSION. THIS CONTROL MAY CONSIST OF EFFECTIVE PLANING, EROSION CONTROL BLANKETS, SOIL STABILIZERS OR OTHER APPROVED MEANS.
65. PROVIDE RIP-RAP OR OTHER REDUCER AT DISCHARGE END OF DRAINS NOT CONNECTED TO A PERMANENT SYSTEM. SHOW DETAIL. [3316.2]
66. ALL STORM DRAIN WORK IS TO BE DONE UNDER CONTINUOUS INSPECTION BY THE ENGINEER. WEEKLY STATUS REPORT SHALL BE SUBMITTED BY THE FIELD ENGINEER TO THE CITY BUILDING DEPARTMENT.
67. SEPARATE PLANS FOR TEMPORARY DRAINAGE AND WET WEATHER EROSION CONTROL MEASURES TO BE USED DURING THE RAINY SEASON MUST BE SUBMITTED PRIOR TO OCTOBER 1. THE EROSION CONTROL DEVISES SHOWN ON SAID PLANS MUST BE INSTALLED BY NO LATER THAN NOVEMBER 1 AND MAINTAINED IN OPERABLE CONDITION UNTIL APRIL 15. [3319.3]
68. ALL RECOMMENDATIONS INCLUDED IN THE CONSULTANT'S SOIL AND GEOLOGY REPORTS MUST BE COMPLIED WITH AND ARE A PART OF THE GRADING SPECIFICATIONS.
69. THE CONSULTING GEOLOGIST MUST APPROVE ROUGH GRADING BY FINAL REPORT. FINAL REPORT MUST INCLUDE AN AS-BUILT GEOLOGIC MAP.
70. THE BUILDING OFFICIAL SHALL APPROVE STOCK PILING OF EXCESS MATERIAL PRIOR TO EXCAVATION.
71. THE FIELD ENGINEER, AS A CONDITION OF ROUGH GRADE APPROVAL, SHALL PROVIDE A BLUE BLUE TOP WITH ACCOMPANYING WITNESS STAKE, SET AT THE CENTER OF EACH PAD REFLECTING THE PAD ELEVATION FOR PRECISE PERMITS AND A BLUE TOP WITH WITNESS STAKE SET AT THE DRAINAGE SWALE HIGH POINT REFLECTING THE HIGH POINT ELEVATION FOR PRELIMINARY PERMITS.
72. THE COMPACTION REPORT AND APPROVAL FROM THE SOIL ENGINEER SHALL INDICATE THE TYPE OF FIELD-TESTING PERFORMED. EACH TEST SHALL BE IDENTIFIED WITH THE METHOD OF OBTAINING THE IN-PLACE DENSITY, WHETHER SAND CONE OR NUCLEAR GAUGE, AND SHALL BE SO NOTED FOR EACH TEST.

PUBLIC WORKS DEPARTMENT GENERAL NOTES

73. ALL WORK SHOWN ON THESE PLANS SHALL BE CONSTRUCTED IN ACCORDANCE WITH THE CURRENT EDITION OF THE STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION (SSPWC) "GREEN BOOK."
74. CONTRACTORS SHALL COMPLY WITH ALL APPLICABLE DIVISION OF INDUSTRIAL REGULATIONS (CAL-OSHA) SAFETY STANDARDS. IF REQUESTED BY THE INSPECTOR, THE CONTRACTOR SHALL PROVIDE PROOF OF A PERMIT FROM SAID DIVISION.
75. CONTRACTOR SHALL CALL THE PUBLIC WORKS INSPECTOR AT (310) 456-2489, EXT. 235 FOR PRE-CONSTRUCTION MEETING PRIOR TO THE COMMENCEMENT OF ANY CONSTRUCTION OR GRADING OPERATIONS. CONTRACTOR SHALL NOTIFY THE CITY PUBLIC WORKS INSPECTOR 48 HOURS PRIOR TO COMMENCING ANY CONSTRUCTION AND 24 HOURS IN ADVANCE OF A SPECIFIC INSPECTION NEEDS DURING THE COURSE OF THE WORK.
76. NO IMPROVEMENTS ARE PROPOSED WITHIN THE PUBLIC RIGHT-OF-WAY.
77. STORAGE OF ANY CONSTRUCTION MATERIALS, CONSTRUCTION TRAILER, AND/OR PARKING AND ANY WORK WITH WITHIN THE CALTRANS PUBLIC RIGHT OF WAY SHALL REQUIRE A CALTRANS ENCROACHMENT PERMIT. SUBMIT A COPY OF THE CALTRANS ENCROACHMENT PERMIT TO THE PUBLIC WORKS DEPARTMENT.
78. ALL WORK SHALL BE PERFORMED DURING CITY WORKING HOURS AND IN COMPLIANCE WITH THESE PLANS.
79. CONTRACTOR SHALL VERIFY ALL CONDITIONS AND DIMENSIONS AND SHALL REPORT ANY DISCREPANCIES TO THE ENGINEER PRIOR TO THE COMMENCEMENT OF ANY WORK.
80. CONTRACTOR SHALL LOCATE, PROTECT, AND SAVE ANY AND ALL SURVEY MONUMENTS THAT WILL BE OR MAY BE DAMAGED OR DESTROYED BY THEIR OPERATIONS. ONCE FOUND, THE CONTRACTOR SHALL THEN NOTIFY BOTH THE DEVELOPER'S SUPERVISING CIVIL ENGINEER AND THE PUBLIC WORKS INSPECTOR. THE SUPERVISING CIVIL ENGINEER SHALL RESET ALL SAID MONUMENTS PER THE REQUIREMENTS OF THE PROFESSIONAL LAND SURVEYOR'S ACT.
81. THE CONTRACTOR SHALL BE RESPONSIBLE FOR PROTECTING ALL PUBLIC AND PRIVATE PROPERTY INSOFAR AS IT MAY BE AFFECTED BY THESE OPERATIONS.
82. EXISTING TRAFFIC SIGNS ARE NOT TO BE REMOVED WITHOUT PRIOR TO NOTIFICATION AND APPROVAL OF THE CITY ENGINEER. AS A MINIMUM, CONSTRUCTION WORK ZONE TRAFFIC SIGNS AND STRIPING SHALL BE FURNISHED, INSTALLED, AND MAINTAINED IN ACCORDANCE WITH THE "WORK AREA TRAFFIC CONTROL HANDBOOK ("THE WATCH MANUAL"), PUBLISHED BY BNI BUILDING NEWS, INC. A TRAFFIC CONTROL PLAN, PREPARED BY THE DEVELOPER, MAY BE REQUIRED BY THE CITY.
83. DUST CONTROL SHALL BE MAINTAINED AT ALL TIMES.
84. EROSION CONTROL PLANS SHALL BE PROVIDED FOR ALL PROJECTS. GRADING AND CLEARING IS PROHIBITED FROM NOVEMBER 1 TO MARCH 31 FOR ALL DEVELOPMENTS WITHIN OR ADJACENT TO ESHA AND/OR INCLUDING GRADING ON SLOPES GREATER THAN 4:1.
85. ALL UNDERGROUND UTILITIES AND SERVICE LATERALS SHALL BE INSTALLED PRIOR TO CONSTRUCTION OF CURBS, GUTTERS, SIDEWALKS, AND PAVING UNLESS OTHERWISE PERMITTED BY THE CITY ENGINEER.
86. THE DEVELOPER SHALL COMPLY WITH NDPES REQUIREMENTS. THE STORM WATER POLLUTION PREVENTION PLAN (SWPPP) SHALL BE AVAILABLE AT THE CONSTRUCTION SITE AT ALL TIMES AND SHALL BE KEPT UP TO DATE.
87. ALL RECOMMENDATIONS MADE BY THE GEOTECHNICAL/SOILS ENGINEER (AND ENGINEERING GEOLOGIST, WHERE EMPLOYED), AND CONTAINED IN THE REPORTS REFERENCED HEREON, AS APPROVED OR CONDITIONED BY THE CITY, SHALL BE CONSIDERED A PART OF THE GRADING PLAN.
88. ALL FOUNDATION EXCAVATION MUST BE OBSERVED AND APPROVED BY THE GEOTECHNICAL CONSULTANT PRIOR TO PLACEMENT OF REINFORCING STEEL.
89. ALL STORM DRAIN PIPE WITHIN THE PUBLIC RIGHT-OF-WAY AND EASEMENTS SHALL BE REINFORCED CONCRETE PIPE (RCP).
90. TERRACE DRAINS, INTERCEPTOR DRAINS, AND DOWN DRAINS SHALL BE CONSTRUCTED OF 3" P.C.C. REINFORCED WITH 6"x6"x#10 W.W.M. AND SHALL BE EITHER SEMICIRCULAR OR TRIANGULAR CROSS SECTION. CONCRETE COLOR SHALL BE "OMAHA TAN" OR APPROVED EQUIVALENT.
91. GRADING QUANTITIES:
    CUT: 4,977 CU. YDS. FILL: 1,711 CU. YDS.
    EXPORT: 3,266 CU. YDS. IMPORT: 0 CU. YDS.
92. GROSS LOT AREA: 6.57 ACRES/SQ. FT.
    NET LOT AREA: 5.86 ACRES/SQ. FT.
    PROPOSED IMPERMEABLE COVERAGE: 21,295 SQ. FT.
    MAXIMUM ALLOWABLE IMPERMEABLE COVERAGE: 25,000 SQ. FT.
    TOTAL DISTURBED AREA: 116,800 SQ. FT.
    FLOOD ZONE ON FIRM: X BASE FLOOD ELEVATION: 0 FT.
93. ALL SLOPES ON PRIVATE PROPERTY ADJOINING STREETS, DRAINAGE CHANNELS, OR OTHER PUBLIC FACILITIES SHALL BE GRADED NOT STEEPER THAN 2:1 FOR CUT AND FILL UNLESS SPECIFICALLY APPROVED BY THE CITY ENGINEER ON RECOMMENDATION OF THE PROJECT'S GEOTECHNICAL/SOILS CONSULTANT.
94. ALL CATCH BASINS AND DRAINAGE INLETS SHALL BE STENCILED WITH THE CITY OF MALIBU STORM DRAIN LOGO

CONDITIONS OF APPROVAL

THIS PLAN CONFORMS TO THE COASTAL DEVELOPMENT PERMIT CONDITIONALLY APPROVED BY THE CITY FOR _____ ON _____

CONTRACTORS NOTE:

THE EARTHWORK QUANTITIES ARE PROVIDED AS A COURTESY AND CONVENIENCE TO THE OWNERS, AND ARE FOR BONDING AND PLAN CHECK PURPOSES ONLY. THE YARDAGE FIGURES SHOWN ARE APPROXIMATE CALCULATED QUANTITIES BASED ON THE DIFFERENCE BETWEEN EXISTING GROUND ELEVATIONS AND DESIGNED ROUGH GRADE ELEVATIONS. THE CALCULATIONS MAKE NO PROVISIONS FOR STRIPPING, SHRINKAGE, BULKING OR ANY OTHER CONDITION NOT IMPLIED. FOR THIS REASON, IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO CONSULT THE PROJECTS SOILS ENGINEER AND GEOLOGIC INVESTIGATIONS, AND TO DETERMINE FOR HIMSELF, THE QUANTITIES OF EARTH MOVING THAT WILL BE REQUIRED TO COMPLETE THIS PROJECT.

STARTING DATE 30 DAYS AFTER PERMIT ISSUANCE ,2022

COMPLETION DATE 90 DAYS AFTER PERMIT ISSUANCE ,2022

NOTE: GRADING PERMITS SHALL NOT BE ISSUED BETWEEN NOVEMBER 1 AND MARCH 31 EACH YEAR PER LCP SECTION 17.2.1. PROJECT APPROVED FOR GRADING PERMIT SHALL NOT RECEIVE GRADING PERMITS UNLESS THE PROJECT CAN BE ROUGH GRADED BEFORE NOVEMBER 1.

NOTE: EXPORTED SOIL FROM A SITE SHALL BE TAKEN TO THE COUNTY LANDFILL OR TO A SITE WITH AN ACTIVE GRADING PERMIT AND THE ABILITY TO ACCEPT THE MATERIAL IN COMPLIANCE WITH THE CITY'S LOCAL IMPLEMENTATION PLAN (LIP), SECTION 8.3.

NOTE: PRIOR TO THE PLACEMENT OF CONCRETE SLABS, THE SLAB SUBGRADE SOILS SHALL BE PRE-MOISTENED TO AT LEAST 120% OF THE OPTIMUM MOISTURE CONTENT TO THE DEPTH SPECIFIED BY THE GEOTECHNICAL ENGINEER. THE PRE-MOISTENED SOILS SHOULD BE TESTED AND VERIFIED TO BE BY THE GEOTECHNICAL ENGINEER WITHIN ONE DAY PRIOR TO THE PLACEMENT OF THE MOISTURE BARRIER AND SAND.

FIRE SAFETY

700 FIRE DEPARTMENT VEHICULAR ACCESS ROADS MUST BE INSTALLED AND MAINTAINED IN A SERVICEABLE MANNER PRIOR TO AND DURING THE TIME OF CONSTRUCTION. FIRE CODE 5001.4
701 AN APPROVED KEY BOX, LISTED IN ACCORDANCE WITH UL 1037 SHALL BE PROVIDED AS REQUIRED BY FIRE CODE 506. THE LOCATION OF EACH KEY BOX SHALL BE DETERMINED BY THE FIRE INSPECTOR.
702 ALL REQUIRED PUBLIC FIRE HYDRANTS SHALL BE INSTALLED, TESTED AND ACCEPTED PRIOR TO BEGINNING CONSTRUCTION. FIRE CODE 501.4
703 PROVIDE AN APPROVED AUTOMATIC FIRE SPRINKLER SYSTEM AS SET FORTH BY BUILDING CODE 903 AND FIRE CODE 9003. PLANS SHALL BE SUBMITTED TO THE SPRINKLER PLAN CHECK UNIT FOR REVIEW AND APPROVAL PRIOR TO INSTALLATION.
704 SMOKE ALARMS SHALL RECEIVE THEIR PRIMARY POWER FROM THE BUILDING WIRING PROVIDED THAT SUCH WIRING IS SERVED FROM A COMMERCIAL SOURCE AND SHALL BE EQUIPPED WITH A BATTERY BACKUP. RESIDENTIAL CODE R314.4
705 WHERE MORE THAN ONE SMOKE ALARM IS REQUIRED TO BE INSTALLED WITHIN AN INDIVIDUAL DWELLING OR SLEEPING UNIT, THE SMOKE ALARMS SHALL BE INTERCONNECTED SIN USCH A MANNER THAT THE ACTIVATION OF ONE ALARM WILL ACTIVATE ALL OF THE ALARMS IN THE INDIVIDUAL UNIT. RESIDENTIAL CODE R314.5
706 APPROVED BUILDING ADDRESS NUMBERS, BUILDING NUMBERS OR APPROVED BUILDING IDENTIFICATION SHALL BE PROVIDED AND MAINTAINED SO AS TO BE PLAINLY VISIBLE AND LEGIBLE FROM THE STREET FRONTING THE PROPERTY. THE MINIMUM OF 4 INCHES HIGH WITH A MINUMM STROKE WIDTH OF 0.5 INCH. FIRE CODE 505.1
707 ALL ROOF COVERINGS SHALL BE CLASS "A" AS SPECIFIED IN BUILDING CODE 1505.1.1 (RESIDENTIAL CODE R327.5.2 & R902)
708 ROOF VALLEY FLASHINGS SHALL BE NOT LESS THAN 0.019 INCH (NO.26 GALVANIZED SHEET GAGE) CORROSION-RESISTANT METAL INSTALLED OVER A MINIMUM 36-INCH WIDE UNDERLAYMENT CONSISTING OF ONE LAYER OF NO. 72 ASTM CAP SHEET MEETING RUNNING THE FULL LEGHTH OF THE VALLEY (RESIDENTIAL CODE R327.5.3 AND BUILDING CODE 705A.3
709 ROOF GUTTERS SHALL BE PROVIDED WITH A MEANS OTO PREVENT THE ACCUMULATION OF LEAVES AND DEBRIS IN THE GUTTER. (RESIDENTIAL CODE R327.534 AND BUILDING GCODE 705A.4)
710 VENTS SHALL RESIST THE INTRUSION OF FLAME AND EMBERS AND FLAME THROUGH THE VENTILATION OPENINGS. VENT OPENINGS SHALL BE PROTECTED BY CORROSION - RESISTANT, NONCOMBUSTIBLE WIRE MESH WITH A MINIMUM 1/14TH INCH OPENINGS AND SHALL NOT EXCEED 1/8TH INCH. VENTS SHALL NOT BE INSTALLED IN EAVES OR CORNICES. (RESIDENTIAL CODE R327.6.1 AND BUILDING CODE 706A.1)
711 CLEARANCE OF BRUSH AND VEGETATIVE GROWTH SHALL BE MAINTAINED PER FIRE CODE 325.
712 PROVIDE APPROVED SIGNS OR OTHER APPROVED NOTICES OR MARKINGS THAT INCLUDE THE WORDS NO PARKING - FIRE LANE. SIGNS SHALL HAVE A MINIMUM DIMENSION OF 12 INCHES WIDE BY 18 INCHES HIGH AND HAVE RED LETTERS ON A WHITE REFLECTIVE BACKGROUND. SIGNS SHALL BE PROVIDED FOR FIRE APPARATUS ACCESS ROADS, TO CLEARLY INDICATE THE ENTRANCE TO SUCH ROAD, OR PROHIBIT THE OBSTRUCTION THEREOF AND AT INTERVALS, AS REQUIRED BY THE FIRE INSPECTOR. FIRE CODE 503.3.
713 ALL FIRE HYDRANTS SHALL MEASURE 6"" X 4"" X 2-1/2"", BRASS OR BRONZE, CONFORMING TO AMERICAN WATER WORKS ASSOCIATION STANDARD C503, OR APPROVED EQUAL.
714 ALL ON-SITE FIRE HYDRANTS SHALL BE INSTALLED, TESTED AND APPROVED PRIOR TO BUILDING OCCUPANCY. FIRE CODE 901.5.1
715 ROOF LADDER ACCESS

Fuel Modification Plan Notes

Ember Resistant Zone

- Extends 5 feet beyond the edge of any combustible structure, accessory structure, appendage, or projection. The area beneath eaves, overhangs or parts of structures including attached decks and pergolas shall be included in the ember resistant zone.
- This area shall be free of materials or landscaping known to be receptive to flying embers.

Zone A

- Extends 30 feet beyond the edge of any combustible structure, accessory structure, appendage, or projection. Projections such as eaves, covered entryways, attached pergolas, decks etc. shall be the point at which this distance is measured.
- Irrigation shall be provided to maintain healthy vegetation and fire resistance.
- Vegetation in this zone shall consist primarily of mowed grasses, low growing ground covers and adequately spaced shrubs. The overall density and arrangement shall provide adequate defensible space and significantly reduce fire intensity.
- Plant species selected for Zone A shall possess characteristics which increase fire resistance. Such characteristics are high moisture content, plants producing little leaf litter, slow growing plants and plants that do not require pruning to reduce their size at maturity. Species selection should reference the Fuel Modification Plant List. The list is not a pre-approved plant list. Other species may be used subject to approval after review.
- Trees are generally not recommended except for dwarf varieties or mature trees less than 25' tall and wide at maturity. Trees shall be positioned so their canopies do not extend over the roof of any structure.
- Vines and climbing plants are not allowed on any combustible structure requiring review.

Zone B

- Extends from the outer edge of Zone A an additional 70 feet for a total of 100 feet from the structure.
- Irrigation shall be provided to maintain healthy vegetation and fire resistance.
- Vegetation in this zone shall be arranged in a manner that does not create vertical or horizontal fuel ladders. Vegetation in this zone can be planted at a slightly higher density than Zone A but the overall density and arrangement shall provide adequate defensible space and significantly reduce fire intensity.
- Existing California native plants may be approved to remain if determined to be acceptable upon review and are properly spaced and maintained.
- Plant species selected for Zone B shall possess characteristics which increase fire resistance. Such characteristics are high moisture content, plants producing little leaf litter, slow growing plants and plants that do not require pruning to reduce their size at maturity. Species selection should reference the Fuel Modification Plant List. The list is not a pre-approved plant list. Other species may be used subject to approval after review.
- Trees in Zone B may be medium to large at maturity provided they are properly positioned and do not create any vertical or horizontal fuel ladders. Tree selections are subject to clerical upon review.

Zone C

- Extends from the outer edge of Zone B an additional 100 feet for a total of 200 feet from the structure.
- Maintenance/modification of vegetation exceeding 100 feet but not to exceed 200 feet from structures may be determined necessary. Any required maintenance/modification is to be determined upon on-site inspection (Fire Code 325.2.2).

Fire Access Road Zone

- Extends a minimum of 10 feet from the edge of any public or private road, driveways and turnarounds used by firefighting resources.
- Clear and remove flammable vegetation on each side of access roads (Fire Code 325.10).
- Fire access roads shall have an unobstructed vertical clearance a minimum width of 20' and vertically clear to the sky (Fire Code 503.2.1).
- Additional clearance beyond 10 feet may be required upon an on-site inspection.
- All proposed plantings, unless otherwise approved, shall be positioned so they do not obstruct access at maturity. Pruning will not be considered as an alternative to plant selection.

Maintenance

Routine maintenance shall be regularly performed in all zones. Above all else, regular maintenance is paramount to the fire resistance of a well-planned fire-resistant landscape. Critical items are outlined below. Additional information may be found on our website listed in the header of this document.

- Start with the structure. Remove leaf litter and other combustible debris from roofs, eaves, rain gutters etc.
- Ensure the ember resistant zone is maintained free of any material known to be receptive to flying embers.
- Remove any plant or portion or a plant that is dead or dying throughout all zones.
- Remove downed, accumulated plant litter and dead wood throughout all zones.
- Prune to reduce the overall amount and continuity of fuels. Eliminate horizontal and vertical fuel ladders throughout all zones.
- All invasive species and their parts should be removed from the site.
- Ensure irrigation systems are functioning properly.
- Compliance with the fire code is a year-round responsibility. Enforcement will occur following inspection by the Fire Department. Annual inspections for brush clearance code requirements are conducted following the natural drying of fine fuels between the months of April and June depending on the geographic region each dwelling exists.
- Inspection for compliance with an approved fuel modification plan may occur at any time.
- All future planting shall be in accordance with the County of Los Angeles Fire Department Fuel Modification Guidelines and approved prior to installation.

Approval of this Fuel Modification Plan constitutes approval for only those Codes reviewed as part of the Fuel Modification process and does not replace the needed approval of any other office or agency with jurisdiction and review responsibility for those items which may or may not be illustrated on the plan.

KEY NOTES:

SITE

001 MAINTAIN ALL WATER RUNOFF WITHIN PROPERTY. SLOPE AWAY FROM P.L. AT A MIN. SLOPE OF ¼" /FT., REFER TO CIVIL DWGS.
002 TREES/LANDSCAPING PLANTING/GROUND COVER/LAWN, REFER TO LANDSCAPE DWGS.
003 HEDGE. REFER TO LANDSCAPE DWGS.
004 HARDSCAPE. REFER TO LANDSCAPE DWGS.
005 DRIVEWAY. GRAVEL ON GRADE. REFER TO CIVIL & LANDSCAPE DWGS.
006 WOOD DECK. SIZE OF PLANKS T.B.D. FINISH T.B.D.
007 UNDERGROUND DRAINAGE SYSTEM. REFER TO CIVIL DWGS.
008 INFINITY POOL EDGE.
009 OPEN PARKING, REFER TO CIVIL FOR DETAILS
010 6'-0" SITE RETAINING WALL. REFER TO STRUCTURAL AND LANDSCAPE DWGS.
011 PEDESTRIAN GATE DOOR. PROVIDE SHOP DWGS. FOR ARCHITECT REVIEW.
012 42" MOTORIZED VEHICULAR SLIDING ENTRY GATE. STEEL FRAME. 90% VISUALLY PERMEABLE.
013 42" PERIMETER FENCE. 90% VISUALLY PERMEABLE.
014 CALL BOX
015 TRASH ENCLOSURE AREA
016 STRUCTURAL GRASS DRIVEWAY. GRASSCRETE OR SIMILAR. REFER TO CIVIL & LANDSCAPE DWGS.
017 GENERATOR ON EXISTING CONCRETE PLINTH, BOTTOM OF GENERATOR TO BE ABOVE BFE +1', REFER TO ELECTRICAL DWGS.
018 A/C CONDENSER UNITS BEHIND LANDSCAPE, BOTTOM OF UNITS TO BE ABOVE BFE +1', REFER TO MECHANICAL DWGS.
019 NATURAL LAWN AREA. REFER TO LANDSCAPE DWGS.

MATERIALS

100 ARCHITECTURAL EXPOSED CONCRETE, COLOR T.B.D. REFER TO STRUCTURAL DRAWINGS AND ARCHITECTURAL DETAILS.
101 CUSTOM WOOD DOOR. REFER TO DOOR SCHEDULE.
102 IMPACT RESISTANT SLIDING ALUMINUM WINDOWS / DOORS SYSTEM, LOW-E COATING. REFER TO WINDOW SCHEDULE.
103 PRE-FABRICATED SKYLIGHT ON CONCRETE CURB. REFER TO WINDOW SCHEDULE. SEE SECTION AND DETAILS.
104 GARAGE STEEL DOOR CLADDED WITH CUSTOM CONCRETE PANELS. REFER TO DOOR SCHEDULE.
105 GRAVEL.
106 5/8" G.W.B., FINISH T.B.D.; REFER TO I.D. DWGS.
107 3/8" THERMOCROMEX LIMESTONE PLASTER, SAND FINISH, COLOR T.B.D. 3/8" TYPICAL.
108 TRELLIS. 50 PERCENT OPEN TO THE SKY. DEPTH OF SLOTS TO BE EQUAL TO OR LESS THAN THE WIDTH OF EACH SLOT. PROVIDE SHOP DWGS.
109 REFER TO INTERIOR DESIGN DRAWINGS AND FINISH SCHEDULE.
110 RAMMED EARTH CONSTRUCTION.
111 STONE BENCH.

STRUCTURAL

200 FOUNDATION AND PILES. REFER TO STRUCT. DWGS.
201 COMPACTED EARTH. REFER TO STRCUT. DWGS.
202 RETAINING WALL. REFER TO STRUCT. DWGS.
203 CONCRETE SLAB. REFER TO STRUCT. DWGS.
204 CONCRETE COLUMN. REFER TO STRUCT. DWGS.
205 CONCRETE BEAM. REFER TO STRUCT. DWGS.
206 STEEL COLUMN. REFER TO STRUCT. DWGS.
207 CONCRETE STAIRS. REFER TO STRUCT. DWGS.
208 CONCRETE SHELL FOR POOL. REFER TO STRUCT. DWGS.
209 8" CMU REINFORCED WALL. REFER TO WALL TYPES AND STRUCT. DWGS
210 PROVIDE 2" RECESS ON SLABS ON ALL SHOWERS.
211 OPENING ON CONCRETE SLAB. REFER TO STRUCT. DWGS.

MEP

300 LIGHT FIXTURE/ SEE ARCH. RCP, ELECTRICAL DWGS. AND LIGHTING SPECIFICATIONS.
301 A/C PLENUM SPACE, REFER TO MECHANICAL DWGS. AND RCP. NO COMBUSTIBLES ALLOWED.
302 ROOF DRAIN, REFER TO PLUMBING DWGS. /SEE DETAIL.
303 FLOOR DRAIN, REFER TO PLUMBING DWGS./ SEE DETAIL.
304 DRAIN PIPE TO FIT IN CEILING SPACE, REFER TO PLUMBING DWGS. COORDINATE EXACT LOCATION AND SPECS.
305 KITCHEN HOOD, REFER TO MECH DWGS.
306 KITCHEN HOOD EXHAUST PIPE TO FIT IN CEILING SPACE, REFER TO MECH DWGS. COORDINATE EXACT LOCATION AND SPECS.
307 DESIGNATED POOL EQUIPMENT AREA.
308 GAS WATER HEATER. REFER TO PLUMBING DWGS.
309 ELECTRICAL PANELS. REFER TO ELECTRICAL DWGS.
310 CONDENSER UNITS ON STANDS. REFER TO MECH. DWGS.
311 MINIMUM R:30 BATT INSULATION OR RIGID INSULATION. REFER TO ENERGY CALCULATIONS.
312 ACOUSTICAL INSULATION.
313 MISTING SYSTEM. REFER TO PLUMBING DWGS.
314 SPRINKLER SYSTEM. REFER TO PLUMBING DWGS.
315 HOSE BIB. REFER TO PLUMBING AND LANDSCAPE DWGS.
316 ELECTRICITY, GAS AND WATER. REFER TO MEP DRAWINGS.
317 MOTORIZED VEHICULAR GATE. REFER TO ELECT. DWGS.
318 ALL TOILETS TO BE WALL HUNG. REFER TO MECH. DWGS.
319 LINEAR DRAIN
320 OVERFLOW SCUPPER.

WATERPROOFING

400 CONTINUOUS VAPOR BARRIER. REFER TO ARCH AND STRUCTURAL DWGS.
401 WATERPROOFING MEMBRANE. REFER TO ARCH AND STRUCTURAL DWGS.
402 POOL FINISH/ COLOR TBD.

MISC. ARCHITECTURAL DETAILS

500 CURTAIN CEILING COVE. REFER TO ARCH. DETAIL.
501 CONTINUOUS 1/2" TOOLED WATER DRIP. SEE ARCH. DETAIL.
502 VENT.
503 KITCHEN, BUILT-IN FURNITURE, CABINETRY BY OTHERS. REFER TO KITCHEN SHOP DWGS.
504 5/8" GWB DROPPED CEILING ON 3/4" FURRING STRIPS, PAINTED GWB. COLOR TBD.
505 STAINLESS STEEL SCUPPER IN CONCRETE STRUCTURE. 3" X 3" MIN.OPENING. REFER TO ELEVATION AND PLAN FOR LOCATION.
506 CUSTOM WOOD MILLWORK, REFER TO I.D. DRAWINGS
507 SOLAR PANELS (T.B.D.)
509 CONCEALED LED SCREEN.
510 LADDER ACCESS.

LIGHTING

600 PENDANT LIGHT. REFER TO LIGHTING DWGS.
601 RECESSED DOWN LIGHT. REFER TO LIGHTING DWGS.
602 CONCEALED LINEAR LIGHT. REFER TO LIGHTING DWGS.
603 POOL LINEAR RECESSED LIGHT. REFER TO LIGHTING DWGS.
604 LANDSCAPE LIGHTING. REFER TO LIGHTING DWGS.

FIRE SAFETY

700 FIRE DEPARTMENT VEHICULAR ACCESS ROADS MUST BE INSTALLED AND MAINTAINED IN A SERVICEABLE MANNER PRIOR TO AND DURING THE TIME OF CONSTRUCTION. FIRE CODE 5001.4
701 AN APPROVED KEY BOX, LISTED IN ACCORDANCE WITH UL 1037 SHALL BE PROVIDED AS REQUIRED BY FIRE CODE 506. THE LOCATION OF EACH KEY BOX SHALL BE DETERMINED BY THE FIRE INSPECTOR.
702 ALL REQUIRED PUBLIC FIRE HYDRANTS SHALL BE INSTALLED, TESTED AND ACCEPTED PRIOR TO BEGINNING CONSTRUCTION. FIRE CODE 501.4
703 PROVIDE AN APPROVED AUTOMATIC FIRE SPRINKLER SYSTEM AS SET FORTH BY BUILDING CODE 903 AND FIRE CODE 9003. PLANS SHALL BE SUBMITTED TO THE SPRINKLER PLAN CHECK UNIT FOR REVIEW AND APPROVAL PRIOR TO INSTALLATION.
704 SMOKE ALARMS SHALL RECEIVE THEIR PRIMARY POWER FROM THE BUILDING WIRING PROVIDED THAT SUCH WIRING IS SERVED FROM A COMMERCIAL SOURCE AND SHALL BE EQUIPPED WITH A BATTERY BACKUP. RESIDENTIAL CODE R314.4
705 WHERE MORE THAN ONE SMOKE ALARM IS REQUIRED TO BE INSTALLED WITHIN AN INDIVIDUAL DWELLING OR SLEEPING UNIT, THE SMOKE ALARMS SHALL BE INTERCONNECTED SIN USCH A MANNER THAT THE ACTIVATION OF ONE ALARM WILL ACTIVATE ALL OF THE ALARMS IN THE INDIVIDUAL UNIT. RESIDENTIAL CODE R314.5
706 APPROVED BUILDING ADDRESS NUMBERS, BUILDING NUMBERS OR APPROVED BUILDING IDENTIFICATION SHALL BE PROVIDED AND MAINTAINED SO AS TO BE PLAINLY VISIBLE AND LEGIBLE FROM THE STREET FRONTING THE PROPERTY. THE MINIMUM OF 4 INCHES HIGH WITH A MINIMM STROKE WIDTH OF 0.5 INCH. FIRE CODE 505.1
707 ALL ROOF COVERINGS SHALL BE CLASS "A" AS SPECIFIED IN BUILDING CODE 1505.1.1 (RESIDENTIAL CODE R327.5.2 & R902)
708 ROOF VALLEY FLASHINGS SHALL BE NOT LESS THAN 0.019 INCH (NO.26 GALVANIZED SHEET GAGE) CORROSION-RESISTANT METAL INSTALLED OVER A MINIMUM 36-INCH WIDE UNDERLAYMENT CONSISTING OF ONE LAYER OF NO. 72 ASTM CAP SHEET MEETING RUNNING THE FULL LEGHTH OF THE VALLEY (RESIDENTIAL CODE R327.5.3 AND BUILDING CODE 705A.3
709 ROOF GUTTERS SHALL BE PROVIDED WITH A MEANS OTO PREVENT THE ACCUMULATION OF LEAVES AND DEBRIS IN THE GUTTER. (RESIDENTIAL CODE R327.534 AND BUILDING GCODE 705A.4)
710 VENTS SHALL RESIST THE INTRUSION OF FLAME AND EMBERS AND FLAME THROUGH THE VENTILATION OPENINGS. VENT OPENINGS SHALL BE PROTECTED BY CORROSION- RESISTANT, NONCOMBUSTIBLE WIRE MESH WITH A MINIMUM 1/1ATH INCH OPENINGS AND SHALL NOT EXCEED 1/8TH INCH. VENTS SHALL NOT BE INSTALLED IN EAVES OR CORNICES. (RESIDENTIAL CODE R327.6.1 AND BUILDING CODE 706A.1)
711 CLEARANCE OF BRUSH AND VEGETATIVE GROWTH SHALL BE MAINTAINED PER FIRE CODE 325.
712 PROVIDE APPROVED SIGNS OR OTHER APPROVED NOTICES OR MARKINGS THAT INCLUDE THE WORDS NO PARKING - FIRE LANE. SIGNS SHALL HAVE A MINIMUM DIMENSION OF 12 INCHES WIDE BY 18 INCHES HIGH AND HAVE RED LETTERS ON A WHITE REFLECTIVE BACKGROUND. SIGNS SHALL BE PROVIDED FOR FIRE APPARATUS ACCESS ROADS, TO CLEARLY INDICATE THE ENTRANCE TO SUCH ROAD, OR PROHIBIT THE OBSTRUCTION THEREOF AND AT INTERVALS, AS REQUIRED BY THE FIRE INSPECTOR. FIRE CODE 503.3.
713 ALL FIRE HYDRANTS SHALL MEASURE 6"" X 4"" X 2-1/2"", BRASS OR BRONZE, CONFORMING TO AMERICAN WATER WORKS ASSOCIATION STANDARD C503, OR APPROVED EQUAL.
714 ALL ON-SITE FIRE HYDRANTS SHALL BE INSTALLED, TESTED AND APPROVED PRIOR TO BUILDING OCCUPANCY. FIRE CODE 901.5.1
715 ROOF LADDER ACCESS

KEY NOTES:

SITE

001 MAINTAIN ALL WATER RUNOFF WITHIN PROPERTY. SLOPE AWAY FROM P.L. AT A MIN. SLOPE OF ¼" /FT., REFER TO CIVIL DWGS.
002 TREES/LANDSCAPING PLANTING/GROUND COVER/LAWN, REFER TO LANDSCAPE DWGS.
003 HEDGE. REFER TO LANDSCAPE DWGS.
004 HARDSCAPE. REFER TO LANDSCAPE DWGS.
005 DRIVEWAY. GRAVEL ON GRADE. REFER TO CIVIL & LANDSCAPE DWGS.
006 WOOD DECK. SIZE OF PLANKS T.B.D. FINISH T.B.D.
007 UNDERGROUND DRAINAGE SYSTEM. REFER TO CIVIL DWGS.
008 INFINITY POOL EDGE.
009 OPEN PARKING, REFER TO CIVIL FOR DETAILS
010 4'-0" SITE RETAINING WALL. REFER TO STRUCTURAL AND LANDSCAPE DWGS.
011 PEDESTRIAN GATE DOOR. PROVIDE SHOP DWGS. FOR ARCHITECT REVIEW.
012 42" MOTORIZED VEHICULAR SLIDING ENTRY GATE. STEEL FRAME. 90% VISUALLY PERMEABLE.
013 42" PERIMETER FENCE. 90% VISUALLY PERMEABLE.
014 CALL BOX
015 TRASH ENCLOSURE AREA
016 STRUCTURAL GRASS DRIVEWAY. GRASSCRETE OR SIMILAR. REFER TO CIVIL & LANDSCAPE DWGS.
017 GENERATOR ON EXISTING CONCRETE PLINTH, BOTTOM OF GENERATOR TO BE ABOVE BFE +1', REFER TO ELECTRICAL DWGS.
018 A/C CONDENSER UNITS BEHIND LANDSCAPE, BOTTOM OF UNITS TO BE ABOVE BFE +1', REFER TO MECHANICAL DWGS.
019 NATURAL LAWN AREA. REFER TO LANDSCAPE DWGS.

MATERIALS

100 ARCHITECTURAL EXPOSED CONCRETE, COLOR T.B.D. REFER TO STRUCTURAL DRAWINGS AND ARCHITECTURAL DETAILS.
101 CUSTOM WOOD DOOR. REFER TO DOOR SCHEDULE.
102 IMPACT RESISTANT SLIDING ALUMINUM WINDOWS / DOORS SYSTEM, LOW-E COATING. REFER TO WINDOW SCHEDULE.
103 PRE-FABRICATED SKYLIGHT ON CONCRETE CURB. REFER TO WINDOW SCHEDULE. SEE SECTION AND DETAILS.
104 GARAGE STEEL DOOR CLADDED WITH CUSTOM CONCRETE PANELS. REFER TO DOOR SCHEDULE.
105 GRAVEL.
106 5/8" G.W.B., FINISH T.B.D.; REFER TO I.D. DWGS.
107 3/8" THERMOCROMEX LIMESTONE PLASTER, SAND FINISH, COLOR T.B.D. 3/8" TYPICAL.
108 TRELLIS. 50 PERCENT OPEN TO THE SKY. DEPTH OF SLOTS TO BE EQUAL TO OR LESS THAN THE WIDTH OF EACH SLOT. PROVIDE SHOP DWGS.
109 REFER TO INTERIOR DESIGN DRAWINGS AND FINISH SCHEDULE.
110 RAMMED EARTH CONSTRUCTION.
111 STONE BENCH.

STRUCTURAL

200 FOUNDATION AND PILES. REFER TO STRUCT. DWGS.
201 COMPACTED EARTH. REFER TO STRCUT. DWGS.
202 RETAINING WALL. REFER TO STRUCT. DWGS.
203 CONCRETE SLAB. REFER TO STRUCT. DWGS.
204 CONCRETE COLUMN. REFER TO STRUCT. DWGS.
205 CONCRETE BEAM. REFER TO STRUCT. DWGS.
206 STEEL COLUMN. REFER TO STRUCT. DWGS.
207 CONCRETE STAIRS. REFER TO STRUCT. DWGS.
208 CONCRETE SHELL FOR POOL. REFER TO STRUCT. DWGS.
209 8" CMU REINFORCED WALL. REFER TO WALL TYPES AND STRUCT. DWGS
210 PROVIDE 2" RECESS ON SLABS ON ALL SHOWERS.
211 OPENING ON CONCRETE SLAB. REFER TO STRUCT. DWGS.

MEP

300 LIGHT FIXTURE/ SEE ARCH. RCP, ELECTRICAL DWGS. AND LIGHTING SPECIFICATIONS.
301 A/C PLENUM SPACE, REFER TO MECHANICAL DWGS. AND RCP. NO COMBUSTIBLES ALLOWED.
302 ROOF DRAIN, REFER TO PLUMBING DWGS. /SEE DETAIL.
303 FLOOR DRAIN, REFER TO PLUMBING DWGS./ SEE DETAIL.
304 DRAIN PIPE TO FIT IN CEILING SPACE, REFER TO PLUMBING DWGS. COORDINATE EXACT LOCATION AND SPECS.
305 KITCHEN HOOD, REFER TO MECH DWGS.
306 KITCHEN HOOD EXHAUST PIPE TO FIT IN CEILING SPACE, REFER TO MECH DWGS. COORDINATE EXACT LOCATION AND SPECS.
307 DESIGNATED POOL EQUIPMENT AREA.
308 GAS WATER HEATER. REFER TO PLUMBING DWGS.
309 ELECTRICAL PANELS. REFER TO ELECTRICAL DWGS.
310 CONDENSER UNITS ON STANDS. REFER TO MECH. DWGS.
311 MINIMUM R:30 BATT INSULATION OR RIGID INSULATION. REFER TO ENERGY CALCULATIONS.
312 ACOUSTICAL INSULATION.
313 MISTING SYSTEM. REFER TO PLUMBING DWGS.
314 SPRINKLER SYSTEM. REFER TO PLUMBING DWGS.
315 HOSE BIB. REFER TO PLUMBING AND LANDSCAPE DWGS.
316 ELECTRICITY, GAS AND WATER. REFER TO MEP DRAWINGS.
317 MOTORIZED VEHICULAR GATE. REFER TO ELECT. DWGS.
318 ALL TOILETS TO BE WALL HUNG. REFER TO MECH. DWGS.
319 LINEAR DRAIN
320 OVERFLOW SCUPPER.

WATERPROOFING

400 CONTINUOUS VAPOR BARRIER. REFER TO ARCH AND STRUCTURAL DWGS.
401 WATERPROOFING MEMBRANE. REFER TO ARCH AND STRUCTURAL DWGS.
402 POOL FINISH/ COLOR TBD.

MISC. ARCHITECTURAL DETAILS

500 CURTAIN CEILING COVE. REFER TO ARCH. DETAIL.
501 CONTINUOUS 1/2" TOOLED WATER DRIP. SEE ARCH. DETAIL.
502 VENT.
503 KITCHEN, BUILT-IN FURNITURE, CABINETRY BY OTHERS. REFER TO KITCHEN SHOP DWGS.
504 5/8" GWB DROPPED CEILING ON 3/4" FURRING STRIPS, PAINTED GWB. COLOR TBD.
505 STAINLESS STEEL SCUPPER IN CONCRETE STRUCTURE. 3" X 3" MIN.OPENING. REFER TO ELEVATION AND PLAN FOR LOCATION.
506 CUSTOM WOOD MILLWORK, REFER TO I.D. DRAWINGS
507 SOLAR PANELS (T.B.D.)
509 CONCEALED LED SCREEN.
510 LADDER ACCESS.

LIGHTING

600 PENDANT LIGHT. REFER TO LIGHTING DWGS.
601 RECESSED DOWN LIGHT. REFER TO LIGHTING DWGS.
602 CONCEALED LINEAR LIGHT. REFER TO LIGHTING DWGS.
603 POOL LINEAR RECESSED LIGHT. REFER TO LIGHTING DWGS.
604 LANDSCAPE LIGHTING. REFER TO LIGHTING DWGS.

FIRE SAFETY

700 FIRE DEPARTMENT VEHICULAR ACCESS ROADS MUST BE INSTALLED AND MAINTAINED IN A SERVICEABLE MANNER PRIOR TO AND DURING THE TIME OF CONSTRUCTION. FIRE CODE 5001.4
701 AN APPROVED KEY BOX, LISTED IN ACCORDANCE WITH UL 1037 SHALL BE PROVIDED AS REQUIRED BY FIRE CODE 506. THE LOCATION OF EACH KEY BOX SHALL BE DETERMINED BY THE FIRE INSPECTOR.
702 ALL REQUIRED PUBLIC FIRE HYDRANTS SHALL BE INSTALLED, TESTED AND ACCEPTED PRIOR TO BEGINNING CONSTRUCTION. FIRE CODE 501.4
703 PROVIDE AN APPROVED AUTOMATIC FIRE SPRINKLER SYSTEM AS SET FORTH BY BUILDING CODE 903 AND FIRE CODE 9003. PLANS SHALL BE SUBMITTED TO THE SPRINKLER PLAN CHECK UNIT FOR REVIEW AND APPROVAL PRIOR TO INSTALLATION.
704 SMOKE ALARMS SHALL RECEIVE THEIR PRIMARY POWER FROM THE BUILDING WIRING PROVIDED THAT SUCH WIRING IS SERVED FROM A COMMERCIAL SOURCE AND SHALL BE EQUIPPED WITH A BATTERY BACKUP. RESIDENTIAL CODE R314.4
705 WHERE MORE THAN ONE SMOKE ALARM IS REQUIRED TO BE INSTALLED WITHIN AN INDIVIDUAL DWELLING OR SLEEPING UNIT, THE SMOKE ALARMS SHALL BE INTERCONNECTED SIN USCH A MANNER THAT THE ACTIVATION OF ONE ALARM WILL ACTIVATE ALL OF THE ALARMS IN THE INDIVIDUAL UNIT. RESIDENTIAL CODE R314.5
706 APPROVED BUILDING ADDRESS NUMBERS, BUILDING NUMBERS OR APPROVED BUILDING IDENTIFICATION SHALL BE PROVIDED AND MAINTAINED SO AS TO BE PLAINLY VISIBLE AND LEGIBLE FROM THE STREET FRONTING THE PROPERTY. THE MINIMUM OF 4 INCHES HIGH WITH A MINUMM STROKE WIDTH OF 0.5 INCH. FIRE CODE 505.1
707 ALL ROOF COVERINGS SHALL BE CLASS "A" AS SPECIFIED IN BUILDING CODE 1505.1.1 (RESIDENTIAL CODE R327.5.2 & R902)
708 ROOF VALLEY FLASHINGS SHALL BE NOT LESS THAN 0.019 INCH (NO.26 GALVANIZED SHEET GAGE) CORROSION-RESISTANT METAL INSTALLED OVER A MINIMUM 36-INCH WIDE UNDERLAYMENT CONSISTING OF ONE LAYER OF NO. 72 ASTM CAP SHEET MEETING RUNNING THE FULL LEGHTH OF THE VALLEY (RESIDENTIAL CODE R327.5.3 AND BUILDING CODE 705A.3
709 ROOF GUTTERS SHALL BE PROVIDED WITH A MEANS OTO PREVENT THE ACCUMULATION OF LEAVES AND DEBRIS IN THE GUTTER. (RESIDENTIAL CODE R327.534 AND BUILDING GCODE 705A.4)
710 VENTS SHALL RESIST THE INTRUSION OF FLAME AND EMBERS AND FLAME THROUGH THE VENTILATION OPENINGS. VENT OPENINGS SHALL BE PROTECTED BY CORROSION- RESISTANT, NONCOMBUSTIBLE WIRE MESH WITH A MINIMUM 1/14TH INCH OPENINGS AND SHALL NOT EXCEED 1/8TH INCH. VENTS SHALL NOT BE INSTALLED IN EAVES OR CORNICES. (RESIDENTIAL CODE R327.6.1 AND BUILDING CODE 706A.1)
711 CLEARANCE OF BRUSH AND VEGETATIVE GROWTH SHALL BE MAINTAINED PER FIRE CODE 325.
712 PROVIDE APPROVED SIGNS OR OTHER APPROVED NOTICES OR MARKINGS THAT INCLUDE THE WORDS NO PARKING - FIRE LANE. SIGNS SHALL HAVE A MINIMUM DIMENSION OF 12 INCHES WIDE BY 18 INCHES HIGH AND HAVE RED LETTERS ON A WHITE REFLECTIVE BACKGROUND. SIGNS SHALL BE PROVIDED FOR FIRE APPARATUS ACCESS ROADS, TO CLEARLY INDICATE THE ENTRANCE TO SUCH ROAD, OR PROHIBIT THE OBSTRUCTION THEREOF AND AT INTERVALS, AS REQUIRED BY THE FIRE INSPECTOR. FIRE CODE 503.3.
713 ALL FIRE HYDRANTS SHALL MEASURE 6"" X 4"" X 2-1/2"", BRASS OR BRONZE, CONFORMING TO AMERICAN WATER WORKS ASSOCIATION STANDARD C503, OR APPROVED EQUAL.
714 ALL ON-SITE FIRE HYDRANTS SHALL BE INSTALLED, TESTED AND APPROVED PRIOR TO BUILDING OCCUPANCY. FIRE CODE 901.5.1
715 ROOF LADDER ACCESS

WATERPROOFING

400 CONTINUOUS VAPOR BARRIER. REFER TO ARCH AND STRUCTURAL DWGS.
401 WATERPROOFING MEMBRANE. REFER TO ARCH AND STRUCTURAL DWGS.
402 POOL FINISH/ COLOR TBD.

MISC. ARCHITECTURAL DETAILS

500 CURTAIN CEILING COVE. REFER TO ARCH. DETAIL.
501 CONTINUOUS 1/2" TOOLED WATER DRIP. SEE ARCH. DETAIL.
502 VENT.
503 KITCHEN, BUILT-IN FURNITURE, CABINETRY BY OTHERS. REFER TO KITCHEN SHOP DWGS.
504 5/8" GWB DROPPED CEILING ON 3/4" FURRING STRIPS, PAINTED GWB. COLOR TBD.
505 STAINLESS STEEL SCUPPER IN CONCRETE STRUCTURE. 3" X 3" MIN.OPENING. REFER TO ELEVATION AND PLAN FOR LOCATION.
506 CUSTOM WOOD MILLWORK, REFER TO I.D. DRAWINGS
507 SOLAR PANELS (T.B.D.)
509 CONCEALED LED SCREEN.
510 LADDER ACCESS.

LIGHTING

600 PENDANT LIGHT. REFER TO LIGHTING DWGS.
601 RECESSED DOWN LIGHT. REFER TO LIGHTING DWGS.
602 CONCEALED LINEAR LIGHT. REFER TO LIGHTING DWGS.
603 POOL LINEAR RECESSED LIGHT. REFER TO LIGHTING DWGS.
604 LANDSCAPE LIGHTING. REFER TO LIGHTING DWGS.

FIRE SAFETY

700 FIRE DEPARTMENT VEHICULAR ACCESS ROADS MUST BE INSTALLED AND MAINTAINED IN A SERVICEABLE MANNER PRIOR TO AND DURING THE TIME OF CONSTRUCTION. FIRE CODE 5001.4
701 AN APPROVED KEY BOX, LISTED IN ACCORDANCE WITH UL 1037 SHALL BE PROVIDED AS REQUIRED BY FIRE CODE 506. THE LOCATION OF EACH KEY BOX SHALL BE DETERMINED BY THE FIRE INSPECTOR.
702 ALL REQUIRED PUBLIC FIRE HYDRANTS SHALL BE INSTALLED, TESTED AND ACCEPTED PRIOR TO BEGINNING CONSTRUCTION. FIRE CODE 501.4
703 PROVIDE AN APPROVED AUTOMATIC FIRE SPRINKLER SYSTEM AS SET FORTH BY BUILDING CODE 903 AND FIRE CODE 9003. PLANS SHALL BE SUBMITTED TO THE SPRINKLER PLAN CHECK UNIT FOR REVIEW AND APPROVAL PRIOR TO INSTALLATION.
704 SMOKE ALARMS SHALL RECEIVE THEIR PRIMARY POWER FROM THE BUILDING WIRING PROVIDED THAT SUCH WIRING IS SERVED FROM A COMMERCIAL SOURCE AND SHALL BE EQUIPPED WITH A BATTERY BACKUP. RESIDENTIAL CODE R314.4
705 WHERE MORE THAN ONE SMOKE ALARM IS REQUIRED TO BE INSTALLED WITHIN AN INDIVIDUAL DWELLING OR SLEEPING UNIT, THE SMOKE ALARMS SHALL BE INTERCONNECTED SIN USCH A MANNER THAT THE ACTIVATION OF ONE ALARM WILL ACTIVATE ALL OF THE ALARMS IN THE INDIVIDUAL UNIT. RESIDENTIAL CODE R314.5
706 APPROVED BUILDING ADDRESS NUMBERS, BUILDING NUMBERS OR APPROVED BUILDING IDENTIFICATION SHALL BE PROVIDED AND MAINTAINED SO AS TO BE PLAINLY VISIBLE AND LEGIBLE FROM THE STREET FRONTING THE PROPERTY. THE MINIMUM OF 4 INCHES HIGH WITH A MINUMM STROKE WIDTH OF 0.5 INCH. FIRE CODE 505.1
707 ALL ROOF COVERINGS SHALL BE CLASS "A" AS SPECIFIED IN BUILDING CODE 1505.1.1 (RESIDENTIAL CODE R327.5.2 & R902)
708 ROOF VALLEY FLASHINGS SHALL BE NOT LESS THAN 0.019 INCH (NO.26 GALVANIZED SHEET GAGE) CORROSION-RESISTANT METAL INSTALLED OVER A MINIMUM 36-INCH WIDE UNDERLAYMENT CONSISTING OF ONE LAYER OF NO. 72 ASTM CAP SHEET MEETING RUNNING THE FULL LEGHTH OF THE VALLEY (RESIDENTIAL CODE R327.5.3 AND BUILDING CODE 705A.3
709 ROOF GUTTERS SHALL BE PROVIDED WITH A MEANS OTO PREVENT THE ACCUMULATION OF LEAVES AND DEBRIS IN THE GUTTER. (RESIDENTIAL CODE R327.534 AND BUILDING GCODE 705A.4)
710 VENTS SHALL RESIST THE INTRUSION OF FLAME AND EMBERS AND FLAME THROUGH THE VENTILATION OPENINGS. VENT OPENINGS SHALL BE PROTECTED BY CORROSION- RESISTANT, NONCOMBUSTIBLE WIRE MESH WITH A MINIMUM 1/14TH INCH OPENINGS AND SHALL NOT EXCEED 1/8TH INCH. VENTS SHALL NOT BE INSTALLED IN EAVES OR CORNICES. (RESIDENTIAL CODE R327.6.1 AND BUILDING CODE 706A.1)
711 CLEARANCE OF BRUSH AND VEGETATIVE GROWTH SHALL BE MAINTAINED PER FIRE CODE 325.
712 PROVIDE APPROVED SIGNS OR OTHER APPROVED NOTICES OR MARKINGS THAT INCLUDE THE WORDS NO PARKING - FIRE LANE. SIGNS SHALL HAVE A MINIMUM DIMENSION OF 12 INCHES WIDE BY 18 INCHES HIGH AND HAVE RED LETTERS ON A WHITE REFLECTIVE BACKGROUND. SIGNS SHALL BE PROVIDED FOR FIRE APPARATUS ACCESS ROADS, TO CLEARLY INDICATE THE ENTRANCE TO SUCH ROAD, OR PROHIBIT THE OBSTRUCTION THEREOF AND AT INTERVALS, AS REQUIRED BY THE FIRE INSPECTOR. FIRE CODE 503.3.
713 ALL FIRE HYDRANTS SHALL MEASURE 6"" X 4"" X 2-1/2"", BRASS OR BRONZE, CONFORMING TO AMERICAN WATER WORKS ASSOCIATION STANDARD C503, OR APPROVED EQUAL.
714 ALL ON-SITE FIRE HYDRANTS SHALL BE INSTALLED, TESTED AND APPROVED PRIOR TO BUILDING OCCUPANCY. FIRE CODE 901.5.1
715 ROOF LADDER ACCESS

REVIEW FINDINGS

Review Status:	☐	**INCOMPLETE**: Additional information and/or a response to the listed review comments is required.
	☒	**APPROVED**: The project has been approved with regards to biological impacts.
	☐	**CANNNOT APPROVE AS SUBMITTED**: The proposed project does not conform to the requirements of the MMC and/or LCP.
	☐	**ERB**: This project has the potential to impact ESHA and may require review by the Environmental Review Board pursuant to LIP Section 4.4.4

Recycled Paper

RECOMMENDATIONS:

1. The project is recommended for **APPROVAL** with the following conditions:

   A. The purpose of this review is to correct a statement made in the August 5, 2021 Biology Review by City Biologist Dave Crawford. The review stated that:

   "Pursuant to LIP Section 4.7.1, the allowable development area is limited to 10,000 square feet as all feasible building areas will result in impacts to Environmentally Sensitive Habitat Area (ESHA)."

   However, upon submission of an additional exhibit by the applicant showing that the 200-foot required fuel modification area does not overlap with the 100-foot ESHA buffer, the above recommendation is not required. The fuel modification area does not overlap with the nearby ESHA or ESHA buffer. Therefore, the 10,000 square foot development area is not required. All other biological recommendations and restrictions are applicable and the stricter shall apply.

-o0o-

If you have any questions regarding the above requirements, please contact the City Biologist office at your earliest convenience.

Matthew Young 4/2/2025

Signature **Date**

The applicant must submit to the City of Malibu Environmental Health Specialist to determine whether or not an onsite wastewater treatment system (OWTS) Plot Plan approval is required.

The Environmental Health Specialist may be contacted Tuesday and Thursday from 8:00 am to 11:00 am, or by calling (310) 456-2489, extension 364.

*Please refer to the appended Environmental Health conformance review dated 8-18-2021 for conditions of final OWTS and building plan check.

*All final project site plans must show the proposed OWTS components.

REVIEW FINDINGS

Planning Stage:	☒	**CONFORMANCE REVIEW COMPLETE** for the City of Malibu Local Coastal Program/Local Implementation Plan (LIP) and Malibu Municipal Code (MMC). The listed conditions of Planning stage conformance review and plan check review comments shall be addressed prior to plan check approval.
	☐	**CONFORMANCE REVIEW INCOMPLETE** for the City of Malibu LIP and MMC. The listed Planning stage review comments shall be addressed prior to conformance review completion.
OWTS Plot Plan:	☐	**NOT REQUIRED**
	☒	**REQUIRED (attached hereto)** ☐ **REQUIRED (not attached)**

Based upon the project description and submittal information noted above, a **conformance review** was completed for a new advanced onsite wastewater treatment system (OWTS) proposed to serve the onsite wastewater treatment and disposal needs of the subject property. The proposed advanced OWTS meets the minimum requirements of the Malibu Municipal Code and the City of Malibu Local Coastal Program (LCP)/Local Implementation Plan (LIP). Please distribute this review sheet to all of the project consultants and, prior to final approval, provide a coordinated submittal addressing all conditions for final approval and plan check items.

The conditional conformance findings hereby transmitted complete the Planning stage Environmental Health review of the subject development project. In order to obtain Environmental Health final approval of the project OWTS Plot Plan and associated construction drawings (during Building Safety plan check),

all conditions and plan check items listed below must be addressed through submittals to the Environmental Health office.

Conditions of Planning Conformance Review for Building Plan Check Approval:

1) **Final Onsite Wastewater Treatment System (OWTS) Plot Plan:** A final plot plan prepared by a City Registered OWTS Designer shall be submitted showing an OWTS design meeting the minimum requirements of the Malibu Municipal Code (MMC) and the Local Coastal Program (LCP)/Local Implementation Plan (LIP). The plans must include all necessary construction details, the proposed drainage plan for the developed property, and the proposed landscape plan for the developed property. The OWTS Plot Plan shall show essential features of the OWTS, existing improvements, and proposed/new improvements. The plot must fit on an 11" x 17" sheet leaving a 5" left margin clear to provide space for a City-applied legend. If the plan scale is such that more space is needed to clearly show construction details and/or all necessary setbacks, larger sheets may also be provided (up to a maximum size of 18" x 22" for review by Environmental Health).

2) **Final OWTS Design Report, Plans, and System Specifications:** A final OWTS design report and large set of construction drawings with system specifications (four sets) shall be submitted to describe the OWTS design basis and all components proposed for use in the construction of the OWTS. All plans and reports must be signed by a City Registered OWTS Designer and the plans stamped by the project Geologist, Coastal Engineer, and Structural Engineer as applicable. The final OWTS design report and construction drawings shall be submitted with the designer's signature, professional registration number, and stamp (if applicable).

   The final OWTS design submittal shall contain the following information (in addition to the items listed above).

   a. Required treatment capacity for wastewater treatment and disinfection systems. The treatment capacity shall be specified in terms of flow rate, gallons per day (gpd), and shall be supported by calculations relating the treatment capacity to the number of bedroom equivalents, plumbing drainage fixture units, and the subsurface effluent dispersal system acceptance rate. The drainage fixture unit count must be clearly identified in association with the design treatment capacity, even if the design is based on the number of bedrooms. Average and peak rates of hydraulic loading to the treatment system shall be specified in the final design.

   b. Sewage and effluent pump design calculations (as applicable).

   c. Description of proposed wastewater treatment and/or disinfection system equipment. State the proposed type of treatment system(s) (e.g., aerobic treatment, textile filter, ultraviolet disinfection, etc.); major components, manufacturers, and model numbers for "package" systems; and the design basis for engineered systems.

   d. Specifications, supporting geology information, and percolation test results for the subsurface effluent dispersal portion of the onsite wastewater disposal system. This must include the proposed type of effluent dispersal system (drainfield, trench, seepage pit, subsurface drip, etc.) as well as the system's geometric dimensions and basic construction features. Supporting calculations shall be presented that relate the results of soils analysis or percolation/infiltration tests to the projected subsurface effluent acceptance rate, including any unit conversions or safety factors. Average and peak rates of hydraulic loading to the effluent

dispersal system shall be specified in the final design. The projected subsurface effluent acceptance rate shall be reported in units of total gallons per day (gpd) and gallons per square foot per day (gpsf). Specifications for the subsurface effluent dispersal system shall be shown to accommodate the design hydraulic loading rate (i.e., average and peak OWTS effluent flow, reported in units of gpd). The subsurface effluent dispersal system design must take into account the number of bedrooms, fixture units, and building occupancy characteristics.

e. All OWTS design drawings shall be submitted with the wet signature and typed name of the OWTS designer. If the plan scale is such that more space than is available on the 11" x 17" plot plan is needed to clearly show construction details, larger sheets may also be provided (up to a maximum size of 18" x 22" for review by Environmental Health). [Note: For OWTS final designs, full-size plans for are also required for review by Building & Safety and Planning.]

3) **Building Plans:** All project architectural plans and grading/drainage plans shall be submitted for Environmental Health review and approval. These plans must be approved by the Building Safety Division prior to receiving Environmental Health final approval.

4) **Traffic-Rated Slab Plan(s):** All project traffic rated slab plans shall be submitted for Environmental Health review and approval. These plans must be approved by the Building Safety Division prior to receiving Environmental Health final approval.

5) **Notice of Decision:** The final onsite wastewater treatment system plans shall include the Conditions of Approval sections of the Notice of Decision (NOD) from the Planning Department.

6) **Architect / Engineer Certification for Reduction in Setbacks to Buildings or Structures:**
All proposed reductions in setbacks from the onsite wastewater treatment system to structures or other features less than those shown in Malibu Municipal Code (MMC) Section 15.42 must be supported by letters from the project consultants. The wastewater plans and the construction plans must be specifically referenced in all certification letters. The construction plans for all structures and/or buildings with reduced setback must be approved by City of Malibu Building Safety prior to Environmental Health final approval. The architectural and/or structural plans submitted for Building Safety plan check must detail methods of construction that will compensate for the reduction in setback (e.g., waterproofing, concrete additives). For complex waterproofing installations, submittal of a separate waterproofing plan may be required. All plans must show the location of onsite wastewater treatment system components in relation to those structures from which the setback is reduced, and the plans must be signed and stamped by the architect, structural engineer, and geotechnical consultants (as applicable).

- Structures – All proposed reductions in setback from the onsite wastewater treatment system to structures (i.e., setbacks less than those shown in MMC Section 15.42) must be supported by a letter from the project Structural Engineer and a letter from the project Soils Engineer (i.e., a Geotechnical Engineer or Civil Engineer practicing in the area of soils engineering). Both engineers must certify unequivocally that the proposed reduction in setbacks from the treatment tank and effluent dispersal area will not adversely affect the structural integrity of the onsite wastewater treatment system and will not adversely affect the structural integrity of the structures for which the setback is reduced.

- Buildings – All proposed reductions in setback from the onsite wastewater treatment system to buildings (i.e., setbacks less than those shown in MMC Section 15.42) also must be supported by

a letter from the project Architect, who must certify unequivocally that the proposed reduction in setbacks will not produce a moisture intrusion problem for the proposed building(s). If the building designer is not a California licensed architect, then the required Architect's certification may be supplied by an Engineer who is responsible for the building design with respect to mitigation of potential moisture intrusion from reduced setback to the wastewater system; in this case the Engineer must include in the letter an explicit statement of responsibility for mitigation of potential moisture intrusion. If any specific construction features are proposed as part of a moisture intrusion mitigation system in connection with the reduced setback(s), then the Architect (or Engineer) must provide associated construction documents for review and approval during Building Plan Check.

7) **Proof of Ownership:** Proof of ownership of subject property shall be submitted.

8) **Operations & Maintenance Manual:** An operations and maintenance manual specified by the OWTS designer shall be submitted to the property owner and maintenance provider of the proposed advanced OWTS.

9) **Maintenance Contract:** A maintenance contract executed between the owner of subject property and an entity qualified in the opinion of the City of Malibu to maintain the proposed advanced onsite wastewater treatment system shall be submitted prior to Environmental Health approval. ***Please note only original "wet* signature" documents are acceptable**.

10) **Advanced Onsite Wastewater Treatment System (OWTS) Covenant:** A covenant running with the land shall be executed between the City of Malibu and the holder of the fee simple absolute as to subject real property and recorded with the City of Malibu Recorder's Office. Said covenant shall serve as constructive notice to any future purchaser for value that the onsite wastewater treatment system serving subject property is an advanced method of sewage disposal pursuant to the City of Malibu Municipal Code. Said covenant shall be provided by the City of Malibu Environmental Health Administrator. ***Please submit a certified* copy issued by the City of Malibu Recorder**.

11) **Covenant to Forfeit 100% Expansion Effluent Disposal Area:** A covenant running with the land shall be executed by the property owner and recorded with the City of Malibu Recorder's Office. Said covenant shall serve as constructive notice to any successors in interest that (1) the private sewage disposal system serving the development on the property does not have a 100% expansion effluent dispersal area (i.e., replacement disposal field(s) or seepage pit(s)) and (2) if the primary effluent dispersal area fails to drain adequately, the City of Malibu may require remedial measures including, but not limited to, limitations on water use enforced through an operating permit and/or repairs, upgrades or modifications to the private sewage disposal system. The recorded covenant shall state and acknowledge that future maintenance and/or repair of the private sewage disposal system may necessitate interruption in use of the private sewage disposal system and, therefore, any building(s) served by the private sewage disposal system may become non-habitable during any required future maintenance and/or repair. Said covenant shall be in a form acceptable to the City Attorney and approved by the Environmental Sustainability Department. ***Please submit a certified copy issued by* the City of Malibu Recorder.**

12) **Project Geologist/Geotechnical Consultant Approval:** Project Geologist/Geotechnical Consultant final approval of the Onsite Wastewater Treatment System plan shall be submitted to the Environmental Health Administrator.

13) **City of Malibu Geologist/Geotechnical Approval:** City of Malibu geotechnical staff final approval of the Onsite Wastewater Treatment System plan shall be submitted to the Environmental Health Administrator.

14) **City of Malibu Planning Approval:** City of Malibu Planning Department final approval of the OWTS plan shall be obtained.

15) **Environmental Health Final Review Fee:** A final fee in accordance with the adopted fee schedule at the time of final approval shall be paid to the City of Malibu for Environmental Health review of the OWTS design and system specifications.

16) **Operating Permit Application and Fee:** In accordance with Malibu Municipal Code, an application shall be made to the Environmental Health office for an Onsite Wastewater Treatment System operating permit. An operating permit fee in accordance with the adopted fee schedule at the time of final approval shall be submitted with the application.

-o0o-

If you have any questions regarding the above requirements, please contact the Environmental Health office at your earliest convenience.

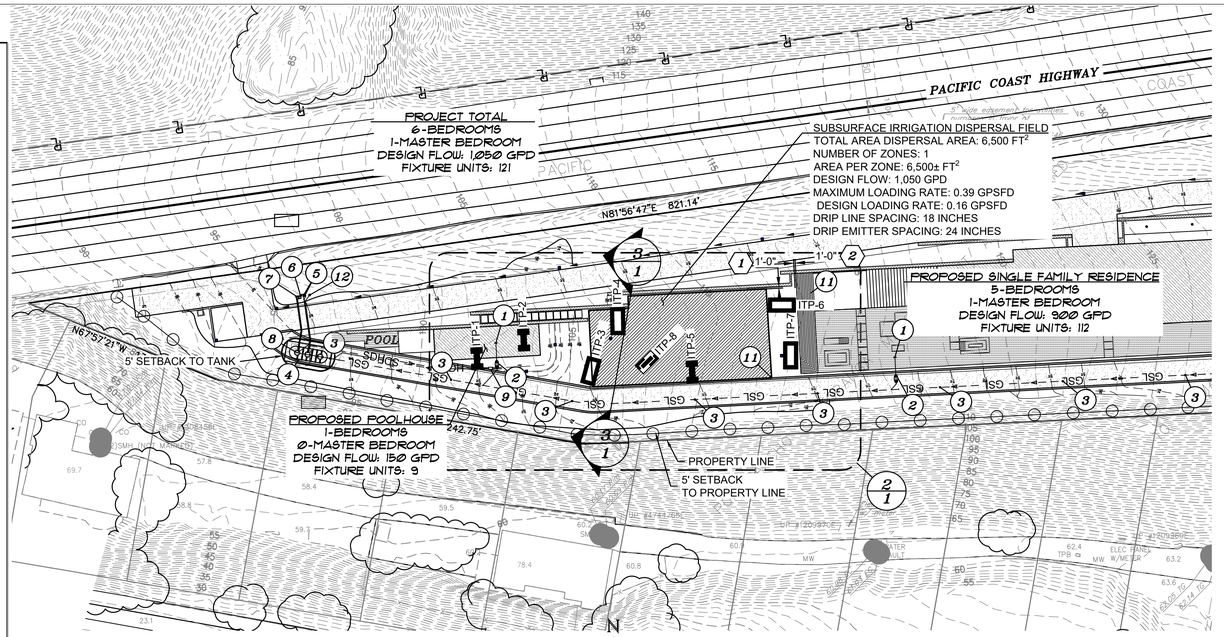
NOTES:

1. This conformance review is for a new 5 bedroom (112 fixture units) single family dwelling, 1 bedroom (9 fixture units) guest house and new advanced onsite wastewater treatment system (OWTS). The new OWTS conforms to the requirements of the Malibu Municipal Code (MMC) and the Local Coastal Program (LCP).

2. This review relates only to the minimum requirements of the MMC, and the LCP, and does not include an evaluation of any geological or other potential problems, which may require an alternative method of wastewater treatment.



3. This review is valid for one year, or until MMC, and/or LCP, and/or Administrative Policy changes render it noncomplying.

GENERAL NOTES:

1. EXISTING OWTS COMPONENTS LOCATION AND ABANDONMENT:
   1.1. CONTRACTOR IS RESPONSIBLE FOR LOCATING ALL EXISTING ONSITE WASTEWATER TREATMENT SYSTEM (OWTS) COMPONENTS. THE LOCATIONS ON THE ENGINEERING PLANS ARE INFORMATIONAL AND MAY NOT INCLUDE ALL COMPONENTS OF THE OWTS. MANY ITEMS, SUCH AS TANKS, PIPING, DISTRIBUTION DEVICES, SEEPAGE PITS, DISPERSAL FIELDS, AND OTHER APPURTENANCES ARE BURIED AND NOT LOCATABLE BY THE SURVEYOR OR UTILITIES LOCATOR .
   1.2. PRIOR TO COMMENCING WORK TO ABANDON, REMOVE, OR REPLACE EXISTING ONSITE WASTEWATER TREATMENT SYSTEM (OWTS) COMPONENTS AN "OWTS ABANDONMENT PERMIT" SHALL BE OBTAINED FROM THE CITY OF MALIBU. ALL WORK PERFORMED IN THE OWTS ABANDONMENT, REMOVAL, OR REPLACEMENT AREA SHALL BE PERFORMED IN STRICT ACCORDANCE WITH ALL APPLICABLE FEDERAL, STATE, AND LOCAL ENVIRONMENTAL AND OCCUPATIONAL SAFETY AND HEALTH REGULATORY REQUIREMENTS. THE OBTAINMENT OF ANY SUCH REQUIRED PERMITS OR APPROVALS FOR THIS SCOPE OF WORK SHALL BE THE RESPONSIBILITY OF THE APPLICANT AND THEIR AGENTS.
   1.3. THE EXISTING OWTS COMPONENTS INCLUDING; SEPTIC TANK(S), PIPING, CLEANOUT(S) SEEPAGE PIT(S), DISPERSAL FIELD(S), AND ALL OTHER APPURTENANCES SHALL BE PROPERLY ABANDONED PURSUANT TO CITY OF MALIBU ORDINANCE 436, SECTION 15.40.170 C, AND SECTION 15.40.170 D, TITLE 28 OF THE LOS ANGELES COUNTY CODE, INCORPORATING THE MOST CURRENT CALIFORNIA PLUMBING CODE, LOCAL PLUMBING CODE, AND POLICIES. METHOD OF ABANDONMENT SHALL BE DETERMINED BY THE ENGINEER AND/OR THE OWNER'S REPRESENTATIVE
2. SEWER PIPE SHALL BE BEDDED IN ACCORDANCE WITH SPECIFICATIONS AND TITLE 28 OF THE LOS ANGELES COUNTY CODE, INCORPORATING THE MOST CURRENT CALIFORNIA PLUMBING CODE, LOCAL PLUMBING CODE, AND ORDINANCES.
3. SYSTEM COMPONENTS AND APPURTENANCES (INCLUDING CLEAN-OUTS, VENTS, BACKWATER VALVES, ETC.) SHALL BE INSTALLED IN ACCORDANCE WITH TITLE 28 OF THE LOS ANGELES COUNTY CODE, INCORPORATING THE MOST CURRENT CALIFORNIA PLUMBING CODE, LOCAL PLUMBING CODE, AND POLICIES.
4. ELECTRICAL COMPONENTS AND APPURTENANCES SHALL BE INSTALLED IN ACCORDANCE WITH TITLE 27 OF THE LOS ANGELES COUNTY CODE, INCORPORATING THE MOST CURRENT CALIFORNIA ELECTRICAL CODE, LOCAL ELECTRICAL CODE, AND ORDINANCES.
5. A REGISTERED GEOTECHNICAL ENGINEER, UNDER THE DIRECTION OF THE OWNER, SHALL DETERMINE IF THE WASTEWATER LOADING RATE WILL CAUSE THE EXISTING SLOPE TO BECOME UNSTABLE. ENSITU ENGINEERING INC., IS NOT A GEOTECHNICAL ENGINEERING FIRM, THEREFORE, WE CAN NOT PREDICT AND/OR DETERMINE THE STABILITY OF THE EXISTING SLOPE.
6. THE PROJECT ENGINEERING GEOLOGIST SHALL OBSERVE THE INSTALLATION OF THE TANK AND DISPERSAL SYSTEM COMPONENTS OF THE AOWTS (INCLUDING BUT NOT LIMITED TO: (A) TANK EXCAVATION, BEDDING, AND BACKFILL (B) SEEPAGE PITS EXCAVATION, CONSTRUCTION, AND BACKFILL (C) SUBSURFACE DISPERSAL SYSTEM BEDDING, FILL MATERIAL, CONSTRUCTION, AND BACKFILL) AND PROVIDE THE CITY INSPECTOR WITH A FIELD MEMORANDUM(S) DOCUMENTING AND VERIFYING THAT THE TANK AND DISPERSAL SYSTEM COMPONENTS WERE INSTALLED PER APPROVED AOWTS PLANS.
7. LEACH FIELDS AND DISPERSAL SYSTEMS DESIGNATED AS SAND CATEGORY: ANY REMAINING FILL MATERIAL AND ANY BEACH SAND SEDIMENT THAT MIGHT HAVE REDUCED PERMEABILITY FROM EXISTING LEACH FIELD OPERATIONS ENCOUNTERED BELOW THE BOTTOM OF THE PROPOSED LEACH FIELD OR ANY MATERIAL ENCOUNTERED IN THE CONSTRUCTION OF THE LEACH FIELD THAT IS NOT CATEGORIZED AS BEACH SAND DEPOSITS SHALL BE EXCAVATED TO THE LEVEL OF THE NATIVE BEACH SAND DEPOSITS AND REPLACED WITH DOUBLE- WASHED SAND. THE PROJECT ENGINEERING GEOLOGIST SHALL OBSERVE THE EXCAVATION OF THE LEACH FIELD AND CONFIRM IN WRITING THAT ALL THE DELETERIOUS FILL AND NON-BEACH SAND MATERIALS BELOW THE LEACH FIELD HAVE BEEN REMOVED AND REPLACED WITH CLEAN SAND AND THE LEACH FIELD WAS CONSTRUCTED IN ACCORDANCE WITH THE APPROVED OWTS PLANS.
8. SUBSURFACE DRIP LINE SHALL BE PLACED IN UNCOMPACTED NATIVE SOILS RIPPED AND TILLED A MINIMUM OF 18 INCHES. SOIL SHALL BE AMENDED TO BE 30% SAND, 30% MULCH, 40% NATIVE OR LANDSCAPE DESIGNER SHALL BE CONTACTED TO ADVISE CONTRACTOR ON TYPE OF TOPSOIL TO IMPORT FOR MINIMUM BURIAL DEPTH. DISPERSAL FIELD SHALL BE PLANTED AND ESTABLISHED PRIOR TO OCCUPANCY (ENGINEER TO VERIFY)
9. ALL DIMENSIONS AND GRADES SHALL BE VERIFIED BY CONTRACTOR PRIOR TO SYSTEM INSTALLATION. BUILDING SEWER DEPTH OR CONNECTION POINT WAS NOT PROVIDED AND SHALL BE DETERMINED BY CONTRACTOR PRIOR TO CONSTRUCTION
10. CONTRACTOR TO VERIFY DEPTH AND LOCATION OF BUILDING SEWER CONNECTION, MINIMUM 2% SLOPE FROM STRUCTURE TO CONNECTION POINT.
11. ONSITE WASTEWATER TREATMENT SYSTEM SHALL BE VENTED IN ACCORDANCE WITH TITLE 28 OF THE LOS ANGELES COUNTY CODE, INCORPORATING THE MOST CURRENT CALIFORNIA PLUMBING CODE, LOCAL PLUMBING CODE, AND POLICIES.

Review Findings

Coastal Development Permit Review

☒ The residential development project is **ACCEPTABLE** from a geotechnical perspective.

☐ The revised soldier pile locations for the residential development project is **NOT ACCEPTABLE** from a geotechnical perspective. The listed 'Review Comments' shall be addressed prior to acceptance.

Building Plan-Check Stage Review

☒ Awaiting Building plan check submittal.

☐ The plans are **COMPLETE** from a geotechnical perspective. Please review the attached 'Geotechnical Notes for Building Plan Check' and incorporate into Building Plan-Check submittals.

☐ The plans are **NOT COMPLETE** from a geotechnical perspective. The listed 'Building Plan-Check Stage Review Comments' shall be addressed prior to Building Plan-Check Stage completion.

Project submittals were reviewed from a geotechnical perspective for conformance with applicable codes, guidelines and standards of practice, including the following current City adopted standards:

- City of Malibu Local Coastal Program – Land Use Plan and Local Implementation Plan (LCP-LUP and LCP-LIP)
- Malibu Municipal Code – Title 15, Buildings and Construction
- City of Malibu Guidelines for the Preparation of Geotechnical Reports and Procedures for Report Submittal (November 2013) referred to herein as Geotechnical Report Guidelines

In the case of conflicting requirements between the Geotechnical Guidelines and any other referenced standards, the latest standard will apply. The Applicant is responsible for complying with the submittal requirements for all Planning variances, as appropriate; any questions regarding variances should be directed to the case Planner.

Remarks

The recent submittal includes a response by Feffer Geological Consulting, the Project Geotechnical Consultant, to the review letter by the City of Malibu dated February 14, 2023 regarding the proposed soldier pile and tieback stabilization system. The referenced response geotechnical report and OWTS design report (appended in the response geotechnical report dated 9-28-2022) were reviewed by the City's consultants from a geotechnical perspective. The project, originally submitted to the City as a Pre-Application (PA) for City geotechnical staff to review to determine if a single-family residential project is feasible on the property, has now been submitted to the City for a Coastal Development Permit (CDP). The project includes a new 9,808 square foot one-story single-family residence with a 2,881 square foot basement/garage, a detached 429 square foot guest bedroom, water features in the basement and the ground floor totaling 10,462 square feet, a swimming pool and plunge pool, covered terraces totaling 5,734 square feet, a tennis court, grading, and retaining walls. The OWTS consists of a treatment tank system (7,540-gallon MicroSeptec ES25 with a UV disinfection unit) and a 5,100 square foot subsurface irrigation dispersal field. The design flow is 1,050 gpd, the maximum loading rate is 0.39 gpsfd and the design loading rate is 0.206 gpsfd.

Building Plan-Check Stage Review Comments:

1. Please submit a fee of $1016.00 to City geotechnical staff for building plan check review.
2. The Project Geotechnical Consultant provides recommendations for earth pressures on retaining walls under static and pseudo-static loading conditions. The consultant used shear strength of bedrock, not backfill materials in the limit equilibrium analyses. As discussed in a phone conversation with the consultant on June 7, 2021, shear strength parameters of backfill materials shall be used. The Consultant provided the undersigned geotechnical reviewer revised earth pressure calculations for retaining walls design that were considered acceptable via email on June 10, 2021. Hence, retaining wall recommendations should be revised accordingly.

   Note: In response to the above comment, the Consultant provided calculations, not revised recommendations, as requested in the above comment. Please provide revised recommendations based on the submitted calculations.
3. The Consultant needs to evaluate the lateral deformation and rotation of the proposed piles when foundations loads and plans become available. Provide the results of the evaluation for review.
4. A schedule of soldier piles diameter, free standing depth, total depth, and the magnitude and points of application of the applied lateral forces/shear and moments need to be depicted on the foundation plans.
5. Tiebacks total length and loading schedule should be depicted on the plans.
6. Areas above tiebacks should be designated as restricted use areas.
7. Tiebacks installation specifications and testing schedule should be depicted on the plans.
8. Please provide reduced setback letters from the OWTS, geotechnical and structural consultants for any reduced setbacks between the OWTS components and new foundations, as applicable.

9. Section 7.4 of the City's geotechnical guidelines requires a minimum thickness of 10 mils for vapor barriers beneath slabs-on-grade. Building plans shall reflect this requirement.

10. Please include the following note on the plans: *"The Project Geotechnical Consultant shall prepare an as-built report documenting the installation of the pile foundation elements for review by City Geotechnical staff. The report shall include total depths of the piles, minimum depth into the recommended bearing material, actual depth into the recommended bearing material, and a map depicting the locations of the piles."*

11. One set of final electronic OWTS plans incorporating the Project Geotechnical and Environmental Health Specialists' recommendations and items in this review sheet must be **reviewed and e-stamped and e-signed by the Project Engineering Geologist**. The City's geotechnical consultants will review the plans for conformance with the Project Geotechnical Consultants' recommendations and items in this review sheet**.**

12. One set of electronic grading, retaining wall, guest bedroom, swimming pool and spa and plunge pool, tennis court, and residence plans **(APPROVED BY BUILDING AND SAFETY)** incorporating the Project Geotechnical Consultant's recommendations and items in this review sheet must be **reviewed and e-stamped and e-signed by the Project Engineering Geologist and Project Civil/Geotechnical Engineer**. City geotechnical staff will review the plans for conformance with the Project Geotechnical Consultants' recommendations and items in this review sheet. Please direct questions regarding this review sheet to City Geotechnical staff listed below.

Please direct questions regarding this review sheet to the City's Geotechnical consultants listed below.

LOS ANGELES COUNTY WATERWORKS DISTRICTS REVIEW
REFERRAL SHEET

FROM: City of Malibu Planning Department **DATE:** 12/02/2021

PROJECT NUMBER: CDP 19-012

JOB ADDRESS: 25200 Pacific Coast Highway, Malibu, CA 90265

APPLICANT / CONTACT: Jake Jesson

APPLICANT EMAIL: jjesson@weintraubre.com

APPLICANT PHONE #: (310) 739-7931

PLANNER: Adrian Fernandez

PROJECT DESCRIPTION:

TO: Malibu Planning Department and/or Applicant

FROM: LACWD No. 29, Malibu

Compliance with the conditions checked below is required prior to Waterworks District approval

The project **DOES NOT** require any system improvements for domestic and/or fire flow conditions _____

The project **DOES NOT** require capital improvement fees and/or participation fees _____

The project **DOES** require a Will Serve Letter ***(Final Waterworks Districts approval)*** ✓

The project **DOES** require capital improvement fees and/or participation fees _____

The project **DOES** require the owner to execute an agreement and participate financially in the design and construction of a future water system to increase local storage and conveyance capacity in the event of an interruption of the primary water supply _____

The project **DOES** require private contract water system improvements for domestic and/or fire flow conditions ✓

The required fire flow for this project set by the Fire Department is 1,350 gallons per minute at 20 pounds per square inch for a 2 hour duration

Scope of water system improvements required:

Installation of approximately 1,000 to 1,500 feet of 8" diameter water main (final length will be determine when we receive the approved hydrant location fom FD), one 6" x 4" x 2-1/2" fire hydrant assembly per Standard detail W-8, one 8" gate valve, one new interconnections to the existing 8" water main, and all necessary appurtenances.

Note: Los Angeles County Waterworks District No. 29, Malibu approval expires upon the earliest of the following: 1) Two years from the date of this form; 2) Expiration date of the City Planning permit(s), or 3) Date County adopts changes to the county of Los Angeles Fire Code an makes revisions to appli le ire Department regulations and standards.

12/15/2021

SIGNATURE **DATE**

Additional requirements/conditions may be imposed upon review of complete architectural plans.
Los Angeles County Waterworks District No. 29, Malibu may be contacted by phone at (310) 317-1389 or at the Waterworks Public Counter:

City of Malibu
MEMORANDUM

To: Planning Department

From: Public Works Department
Jenna Sobieray, Associate Civil Engineer

Date: December 21, 2021

Re: Proposed Conditions of Approval for 25200 Pacific Coast Hwy CDP 19-012

The Public Works Department has reviewed the plans submitted for the above referenced project. Based on this review sufficient information has been submitted to confirm that conformance with the Malibu Local Coastal Plan (LCP) and the Malibu Municipal Code (MMC) can be attained. Prior to the issuance of building and grading permits, the applicant shall comply with the following conditions.

STREET IMPROVEMENTS

1. This project proposes to construct a new driveway within Caltrans' right-of-way. Prior to the Public Works Department approval of the grading or building permit, the applicant shall obtain encroachment permits from Caltrans for the proposed driveway.

2. The applicant shall update and install a new curb and gutter on Pacific Coast Highway to accommodate proposed drainage design. Prior to the Public Works Department approval of the grading or building permit, the applicant shall provide Caltrans approval for Pacific Coast Highway improvements and drainage design.

GRADING AND DRAINAGE

3. Clearing and grading during the rainy season (extending from November 1 to March 31) shall be prohibited for development LIP Section 17.3.1 that:
    - Is located within or adjacent to ESHA, or
    - Includes grading on slopes greater than 4:1
    - Approved grading for development that is located within or adjacent to ESHA or on slopes greater than 4:1 shall not be undertaken unless there is sufficient time to complete grading operations before the rainy season. If grading operations are not completed before the rainy season begins, grading shall be halted and temporary

Recycled Paper

erosion control measures shall be put into place to minimize erosion until grading resumes after March 31, unless the City determines that completion of grading would be more protective of resources

4. Exported soil from a site shall be taken to the County Landfill or to a site with an active grading permit and the ability to accept the material in compliance with the City's LIP Section 8.3. **A note shall be placed on the project that addresses this condition.**

5. A grading and drainage plan shall be approved containing the following information prior to the issuance of grading permits for the project.
    - Public Works Department General Notes
    - The existing and proposed square footage of impervious coverage on the property shall be shown on the grading plan (including separate areas for buildings, driveways, walkways, parking, tennis courts and pool decks).
    - The limits of land to be disturbed during project development shall be delineated on the grading plan and a total area shall be shown on the plan. Areas disturbed by grading equipment beyond the limits of grading, areas disturbed for the installation of the septic system, and areas disturbed for the installation of the detention system shall be included within the area delineated.
    - The grading limits shall include the temporary cuts made for retaining walls, buttresses, and over excavations for fill slopes and shall be shown on the grading plan.
    - If the property contains trees that are to be protected they shall be highlighted on the grading plan.
    - If the property contains rare and endangered species as identified in the resources study the grading plan shall contain a prominent note identifying the areas to be protected (to be left undisturbed). Fencing of these areas shall be delineated on the grading plan if required by the City Biologist.
    - Private storm drain systems shall be shown on the grading plan. Systems greater than 12-inch diameter shall also have a plan and profile for the system included with the grading plan.
    - Public storm drain modifications shown on the grading plan shall be approved by the Public Works Department prior to the issuance of the grading permit.

6. A digital drawing (AutoCAD) of the project's private storm drain system, public storm drain system within 250 feet of the property limits, and post-construction BMP's shall be submitted to the Public Works Department prior to the issuance of grading or building permits. The digital drawing shall adequately show all storm drain lines, inlets, outlet, post-construction BMP's and other applicable facilities. The digital drawing shall also show the subject property, public or private street, and any drainage easements.

7. The applicant shall label all City/County storm drain inlets within 250 feet from each property line per the City of Malibu's standard label template. A note shall be placed on the project plans that address this condition.

8. Prior to the approval of the drainage plan, the applicant shall remove the existing CMP pipe onsite and install a new pipe to redirect water currently draining to the lot. The new pipe shall be designed in accordance with Caltrans and LA County Flood Standards. A video recording and images of the completed pipe shall be submitted to the City of Malibu Public Works Department. Applicant shall coordinate any easements required for the maintenance of the pipe with the appropriate agencies.

STORMWATER

9. The ocean between Latigo Point and the West City limits has been established by the State Water Resources Control Board as an Area of Special Biological Significance (ASBS) as part of the California Ocean Plan. This designation allows discharge of storm water only where it is essential for flood control or slope stability, including roof, landscape, road and parking lot drainage, to prevent soil erosion, only occurs during wet weather, and is composed of only storm water runoff. The applicant shall provide a drainage system that accomplishes the following:

    - Installation of BMPs that are designed to treat the potential pollutants in the storm water runoff so that it does not alter the natural ocean water quality. These pollutants include trash, oil and grease, metals, bacteria, nutrients, pesticides, herbicides and sediment.
    - Prohibits the discharge of trash.
    - Only discharges from existing storm drain outfalls are allowed. No new outfalls will be allowed. Any proposed or new storm water discharged shall be routed to existing storm drain outfalls and shall not result in any new contribution of waste to the ASBS (i.e. no additional pollutant loading).
    - Elimination of non-storm water discharges.

10. A Storm Water Pollution Prevention Plan shall be provided prior to the issuance of the Grading/Building permits for the project. This plan shall include an Erosion and Sediment Control Plan (ESCP) that includes, but not limited to:

Erosion Controls	Hydraulic Mulch
	Hydroseeding
	Soil Binders
	Straw Mulch
	Geotextiles and Mats
	Wood Mulching
Sediment Controls	Fiber Rolls
	Gravel Bag Berm
	Street Sweeping and/ or Vacuum
	Storm Drain Inlet Protection
	Scheduling

	Check Dam
Additional Controls	Wind Erosion Controls
	Stabilized Construction Entrance/ Exit
	Stabilized Construction Roadway
	Entrance/ Exit Tire Wash
Non-Stormwater Management	Vehicle and Equipment Washing
	Vehicle and Equipment Fueling
	Vehicle and Equipment Maintenance
Waste Management	Material Delivery and Storage
	Spill Prevention and Control

All Best Management Practices (BMP) shall be in accordance to the latest version of the California Stormwater Quality Association (CASQA) BMP Handbook. Designated areas for the storage of construction materials, solid waste management, and portable toilets must not disrupt drainage patterns or subject the material to erosion by site runoff.

11. Prior to the approval of any permits and prior to the applicant submitting the required Construction General Permit documents to the State Water Quality Control Board, the applicant shall submit to the Public Works Department for review and approval an Erosion and Sediment Control Plan (ESCP). The ESCP shall contain appropriate site-specific construction site BMPs and developed and certified by a Qualified SWPPP Developer (QWD). All structural BMPs must be designed by a licensed California Engineer. The ESCP must address the following elements:

    - Methods to minimize the footprint of the disturbed area and to prevent soil compaction outside the disturbed area.
    - Methods used to protect native vegetation and trees.
    - Sediment/Erosion Control.
    - Controls to prevent tracking on and off the site.
    - Non-storm water controls.
    - Material management (delivery and storage).
    - Spill Prevention and Control.
    - Waste Management
    - Identification of site Risk Level as identified per the requirements in Appendix 1 of the Construction General Permit.
    - Landowner must sign the following statement on the ESCP:

      "I certify that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief,

Recycled Paper

the information submitted is true, accurate and complete. I am aware that submitting false and/or inaccurate information, failing to update the ESCP to reflect current conditions, or failing to properly and/or adequately implement the ESCP may result in revocation of grading and/or other permits or other sanctions provided by law."

12. A State Construction activity permit is required for this project due to the disturbance of more than one acre of land for development. Provide a copy of the letter from the State Water Quality Control Board containing the WDID number prior to the issuance of grading or building permits.

13. A Storm Water Management Plan (SWMP) is required for this project. Storm drainage improvements are required to mitigate increased runoff generated by property development. The applicant shall have the choice of one method specified within the City's Local Implementation Plan Section 17.3.2.B.2. The SWMP shall be supported by a hydrology and hydraulic study that identifies all areas contributory to the property and an analysis of the predevelopment and post development drainage of the site. The SWMP shall identify the Site design and Source control Best Management Practices (BMP's) that have been implemented in the design of the project (See LIP Chapter 17 Appendix A). The SWMP shall be reviewed and approved by the Public Works Department prior to the issuance of the grading/building permits for this project.

14. A Water Quality Mitigation Plan (WQMP) is required for this project. The WQMP shall be supported by a hydrology and hydraulic study that identifies all areas contributory to the property and an analysis of the predevelopment and post development drainage of the site. The WQMP shall meet all the requirements of the City's current Municipal Separate Stormwater Sewer System (MS4) permit. The following elements shall be included within the WQMP:
    - Site Design Best Management Practices (BMP's)
    - Source Control BMP's
    - Treatment Control BMP's that retains on-site the Stormwater Quality Design Volume (SWQDv). Or where it is technical infeasible to retain on-site, the project must biofiltrate 1.5 times the SWQDv that is not retained on-site.
    - Drainage Improvements
    - A plan for the maintenance and monitoring of the proposed treatment BMP's for the expected life of the structure.
    - A copy of the WQMP shall be filed against the property to provide constructive notice to future property owners of their obligation to maintain the water quality measures installed during construction prior to the issuance of grading or building permits.
    - The WQMP shall be submitted to Public Works Department and the fee applicable at time of submittal for the review of the WQMP shall be paid prior to the start of the technical review. The WQMP shall be approved prior to the Public Works Department's approval of the grading and drainage plan and or building plans.

The Public Works Department will tentatively approve the plan and will keep a copy until the completion of the project. Once the project is completed, the applicant shall verify the installation of the BMP's, make any revisions to the WQMP, and resubmit to the Public Works Department for approval. The original signed and notarized document shall be recorded with the County Recorder. A copy of the WQMP shall be submitted to the Public Works Department prior to the certificate of occupancy.

15. HYDROMODIFICATION – Alteration or disturbance of streams or natural drainage courses or human-made or altered drainage courses that have replaced natural streams or drainages and serve the same function, **shall be prohibited**.
    - Necessary water supply projects where no feasible alternative exists.
    - Flood protection for existing development where there is no other feasible alternative.
    - The improvement of fish and wildlife habitat.

MISCELLANOUS

16. The developer's consulting engineer shall sign the final plans prior to the issuance of permits.

17. The discharge of swimming pool, spa and decorative fountain water and filter backwash, including water containing bacteria, detergents, wastes, algaecides or other chemicals is prohibited. Swimming pool, spa, and decorative fountain water may be used as landscape irrigation only if the following items are met:

    - The discharge water is dechlorinated, debrominated or if the water is disinfected using ozonation;
    - There are sufficient BMPs in place to prevent soil erosion; and
    - The discharge does not reach into the MS4 or to the ASBS (including tributaries)

    Discharges not meeting the above-mentioned methods must be trucked to a Publicly Owned Wastewater Treatment Works.

    The applicant shall also provide a construction note on the plans that directs the contractor to install a new sign stating **"It is illegal to discharge pool, spa or water feature waters to a street, drainage course or storm drain per MMC 13.04.060(D)(5)."** The new sign shall be posted in the filtration and/or pumping equipment area for the property. Prior to the issuance of any permits, the applicant shall indicate the method of disinfection and the method of discharging.

18. The applicant shall prepare a Traffic Impact Analysis (TIA) per the City of Malibu TIA Guidelines. The TIA shall be reviewed and approved by the Public Works Department prior to the issuance of the grading and or building permits. The applicant shall also be

required to construct the applicable mitigation measures recommended in the TIA. The traffic mitigation measures shall be constructed prior to occupancy of the first building.

19. Prior to the commencement of work, the applicant shall submit a copy of their Construction Management Plan. The Construction Management Plan shall include a dedicated parking location for construction workers, not within the public right of way.

20. Prior to the approval of any grading and drainage permit, the applicant shall submit a PDF of the final plans. If there are further modifications to the plans, the applicant shall provide the City with an updated PDF.

21. LOT LINE ADJUSTMENT/LOT MERGER (with development)

    a. The proposed lot line adjustment/lot merger must be approved by the City and filed with the City Clerk's office prior to the approval of this grading permit.
    b. Upon review of the documents provided, the City may require submittal of additional documents or maps, depending upon the completeness of the initial submittal.

We must all come together to oppose these projects in GREAT NUMBERS.

We need a ton of written opposition and in person: 1. On Monday, May 13 at city council for the Malibu Inn Hotel that we will be sending out the multiple risk and violations talking points in the next week and the future obvious threat to Aviator Nation this project holds and 2. On Monday, May 20 at the Planning Commission when this HUGE view blocking beachside property will be likely bulldozed through by our THREE PRO DEVELOPMENT Planning Commissioners. Grisanti continues to show what he really stands for in appointing Dennis Smith who APPROVES EVERYTHING with multiple variances and height violations. Grisanti did this with the Bluffs and the Crummer/Case property he sold out for and now he's going to try and ruin the view here next.

Not again and not if we can help it!

He NEEDS to be voted out in November.

We will keep you posted on what you can do to oppose upcoming projects like this. Stay tuned!

Xx, Jo

Dear Jo, Friends, Neighbors and Planning:

We are in full agreement with you, Jo!

In reference to the project, 180 PCH, as submitted below, it is a true example of excess and a violation of our Mission statement, codes and character — not unlike the Malibu Inn 'HMotel' project.

I am reminded of years past when I worked with Doug Burdge for a client, who loved to remodel vanity projects, including a BASEMENT...ludicrous.

As I learned from Burdge & Associates, the strategy was to always ask for the most outrageous, knowing it would be pared down to what you were truly after... I suspect this was the case with the 'HMotel' and the jokes on planning, who 'planned' his farcical endeavor.

Needless to say, I am unaware of the architect for 180 PCH, or their strategy, albeit very reminiscent of Burdge. The Billionaires Boys Club, in neon, has been illuminated to our detriment. Vanity projects to feed empty vessels. Malibu For Sale by the unscrupulous.

I would ask my friends and neighbors

who occupy the seats of the Planning Commission, especially those who grew up here, to vote with your conscience, and restore the moral compass of our community and values. Or, just apply the codes, lawfully, and the restrictions, stop with the variances.

More is just more, not better. Malibu kids deserve a rural community, untouched nature and open spaces, not the West Coast Miami Beach.

When will we rise up, use our voices and stop this blatant violation and exploitation of Malibu? We are the guardians...or are we?

With gratitude, Jo 🙏🏻

Hi Patricia...thanks for this.

Not sure why I can't reply all as there is no Brown Act issue here. But if you need to send to the other Planning Commissioners please do let them know of the flood of opposition coming to yet another HUGE beachside, insanely view blocking, beach eroding, geology questioning, ocean and ESHA polluting monstrosity in our once quiet, safe and rural beach town.

The City needs to STOP approving boundary and code breaking gigantic projects like these including the upcoming MALIBU INN HOTEL - across from the pier - over the multitude of small EXISTING resident projects and modest fire rebuilds in planning that are hardly as risky. We NEED TO KEEP the open space along our coastline and protect our beaches, cultural resources and scenic views.

Please send the story pole plans and the heights. The story poles definitely show MORE than is described in the CDP info below and should be checked on the applications to match.

Thanks very much, Jo

Worse is that then they'll plant the entire average with trees and shrubs. Even though they're not allowed, this city has NO ENFORCEMENT to protect those scenic ocean views for the public. All of those estates along PCH on the ocean side have blocked the public views with no repercussions whatsoever. None. It's so irresponsible.

We will all need to contact CCC to have those historic views protected an d enforced. It's an exhausting effort because Malibu does not take care of it.

The uber-wealthy win and win and win.

Allison Cook, AICP
Planner to the City of Malibu
capstonecityplan@gmail.com

Hi Allison,

I am the Malibu homeowner, located at [redacted]. with a "Primary View Determination ([redacted])", which protects my ocean view, directly over the proposed development site, located at 25200 Pacific Coast Highway (PCH). The story poles have just been installed at this site which shows the maximum roof height, which I assume is 18 ft. The proposed building structure will partially block my primary ocean view, which I was trying to protect with the PVD. This proposed project is of great concern to our family. We have lived in our home for 30 years and there has never been any structure on the 25200 PCH land as it was deemed too unstable or costly to build upon. It was one of the main reasons we bought our home, confident our view would not be impacted by future development .

I would like to confirm whether there are no height variances being requested for roof line or retaining walls. We understand the maximum roof height is 18 ft. permitted by code. We would also like to request that the landscaping plan call for trees that will be low profile and not grow to a height, in the future, that will block our view. We do not wish to face enforcement issues in the future, continually requiring our neighbors to trim the height of their trees. We are also concerned about the volume of lighting required to light up the proposed complex that will be an "eye-sore" over which we will have to stare at each night.

I would appreciate if you could submit my request, regarding protecting my PVD [redacted] part of your project submission documents to the Planning commission, which is scheduled to meet on May 20, 2024. We will be out of the country during this public hearing and we will need to rely on this letter to represent our concerns to the planning commission. Please let me know if you need any further information or documentation from me prior to May 10th which is my departure date for my trip. My email address is [redacted]

I appreciate your kind assistance helping us with this issue.

Sincerely,

[redacted], Homeowner
[redacted]

April 24, 2024

Allison Cook, AICP

Planner to the City of Malibu

capstonecityplan@gmail.com

Dear Allison,

I am the President of the Malibu Colony Ranch Estates Homeowners Association and the homeowner at [redacted] Puerco Canyon Rd., Malibu, with a "Primary View Determination (PVD-[redacted])" safeguarding my ocean view directly over the proposed development site at 25200 Pacific Coast Highway (PCH). The recently installed story poles reveal a maximum roof height of 18 ft., which, if the proposed building structure proceeds, will partially obstruct my protected ocean view. This is deeply concerning for our family and association members. The absence of any structure on the 25200 PCH land, due to its instability or high construction costs, was a key factor in our decision to purchase this property, assuring us that our view would remain unobstructed.

I seek confirmation that no height variances are being sought for the roofline or retaining walls. While we understand the permissible maximum roof height of 18 ft. according to code, we also request that the landscaping plan incorporate low-profile trees, ensuring they won't grow to obstruct our view in the future. It is our desire to avoid ongoing enforcement issues requiring neighbors to trim tree heights. Additionally, we are apprehensive about the potential visual pollution from excessive lighting illuminating the proposed complex, which would be an unwelcome eyesore in our nightly vista.

I kindly request that you include my plea for the protection of my PVD-[redacted]n your project submission documents to the Planning Commission, convening on May 20, 2024. As I will be out of the country during the public hearing, this letter will serve as our sole means to express our concerns to the commission. Should you require further information or documentation from me before my departure on May 10th, please do not hesitate to reach out via [redacted]

Your assistance in addressing this matter is greatly appreciated.

Sincerely,

Tony Azzi, Homeowner & HOA President

NOTICE OF PUBLIC HEARING

NOTICE OF PUBLIC HEARING

The Malibu Planning Commission will hold a public hearing on **Monday, July 21, 2025, at 6:30 p.m**. in the Council Chambers, Malibu City Hall, 23825 Stuart Ranch Road, Malibu, CA and via teleconference, for the project identified below. Public comment can be submitted ahead of the public hearing to planningcommission@malibucity.org for inclusion in the public record. To participate during the public hearing, please review the meeting agenda posted at MalibuCity.org/AgendaCenter and follow the directions for public participation.

COASTAL DEVELOPMENT PERMIT NO. 19-012, CONDITIONAL CERTIFICATE OF COMPLIANCE NO. 21-004, AND LOT MERGER NO. 24-002 - An application for the construction of a new one-story, 9,219 square- foot single-family residence, including a 1,000 square-foot subterranean two-car garage, 1,523 square-foot basement, 676 square- foot gym, detached 465 square- foot detached guest house, swimming pools, driveways, decks, landscaping, water features, hardscape, grading, retaining walls, and onsite wastewater treatment system; including a conditional certificate of compliance to recognize an illegally created lot consisting of two parcels, and a lot merger to consolidate two parcels into one

LOCATION / APNs:	**25200 Pacific Coast Hwy** / 4459-013-021 & 4459-014-018
ZONING:	Rural Residential-Two Acre (RR-2)
APPLICANT / OWNER:	180 PCH, LLC / PAR PCH LLC
APPEALABLE TO:	City Council and California Coastal Commission
ENVIRONMENTAL REVIEW:	Categorical Exemption CEQA Guidelines Sections 15303(a) and 15303(e)
APPLICATION FILED:	March 7, 2019
CASE PLANNER:	Allison Cook, Contract Planner, capstonecityplan@gmail.com (805) 415-1991

A written staff report will be available at or before the hearing for the project. All persons wishing to address the Commission regarding this matter will be afforded an opportunity in accordance with the Commission's procedures. Copies of all related documents can be reviewed by any interested person at City Hall during regular business hours. Oral and written comments may be presented to the Planning Commission on, or before, the date of the meeting.

LOCAL APPEAL - A decision of the Planning Commission may be appealed to the City Council by an aggrieved person by written statement setting forth the grounds for appeal. An appeal shall be filed with the City Clerk within ten days following the date of action which the appeal is made and shall be accompanied by an appeal form and filing fee, as specified by the City Council. Appeal forms may be found online at www.malibucity.org/planningforms or in person at City Hall, or by calling (310) 456-2489, extension 246.

COASTAL COMMISSION APPEAL - An aggrieved person may appeal the Planning Commission's approval directly to the Coastal Commission within 10 working days of the issuance of the City's Notice of Final Action. More information may be found online at www.coastal.ca.gov or by calling 805-585-1800.

IF YOU CHALLENGE THE CITY'S ACTION IN COURT, YOU MAY BE LIMITED TO RAISING ONLY THOSE ISSUES YOU OR SOMEONE ELSE RAISED AT THE PUBLIC HEARING DESCRIBED IN THIS NOTICE, OR IN WRITTEN CORRESPONDENCE DELIVERED TO THE CITY, AT OR PRIOR TO THE PUBLIC HEARING.

I was asked to send this to you so you know. This property was actively listed on the market in 1994-1995 with the provision that it was not buildable. We checked into it with a prominent local realtor and were told there was no around it. The property was not stable enough on which to be built.
Jacky Tomlinson
I was offered this piece of land back in the 90s for $115,000 which sounded like a great price for such a cool piece of land. Of course we would not have been building anything other than a small home for the 3 of us. Looking into it, though we found that the geological studies would not allow building there and so obviously we decided against it. How unfair is it to me if now they've decided someone else can build something there when we were advised that we could not? And how unsafe is it that they're building something there which is of course the more important matter? Not to mention we wanted a very simple small home and this is a proposed mansion! Obviously it would be a far greater danger to anyone in, below or around such a large home that was not suitable for one a 7th the size? I think we would have law suit and I am not litigious but this is ridiculous! You cannot tell one party they cannot build a 1500 ft.² and then allow an 11,000+ ft.² mansion? Someone forward this to the building committee because I don't know who is on it now?

I oppose the project along PCH and I want to report that the owner has slowly been building up dirt along the roadside so that it covers the poles and looks like he is not blocking the view with his house from the road. I have observed this on a constant basis since he applied for a permit. Now there are weeds growing and it looks like it has always been like that, but he created dirt mound to hide the proposed monster house. The property has always been known to be a slide area and it is above homes on Malibu Rd.

Dear Planning Commission,

As a Malibu resident I oppose this .

Please stop this oversized, risky build that needs more vetting before coming to the Planning Commission. There is also a broken drain pipe that runs directly through the property that needs to be fixed before any approvals can take place as it causes further instability that has not been mentioned in the staff report. And the tall row of trees against the wall along the PCH will block scenic views even further. Fire rebuilds in this city should be prioritized over these maxed out projects that go against everything our vision & mission statement stand for."

Thank you

Hi,

Is there no requirements to have a property geologically tested for stability before it can be built on?

I ask this because it is a no brainer to see that the sliver of land along PCH (where story poles are erected) could not be build on because the steep drop off, and the risk to those homes below that have been there a lot longer than anyone thought the property would be in planning. The whole area is only stable because no one is messing with the land.

What if the plans include a pool? There is no public sewer system, means that they are on septic. Even with the modern tanks, how much fluid will it take to change the stability of that hillside? How long did it take to take out Dukes? Less than 24 hrs. The houses below could be swallowed up entirely!

Please do not turn a blind eye to the repercussions down the road just to get planning/building numbers up. There is a reason no one has built. That too is a no brainer!

Please **deny** any petition to merge these properties and **deny** ANY plans to building at the 25200 Pacific Coast Highway.

Just to make sure you are fully aware that allowing any work on the proposed property will put these homes, below the property, in danger. There is no IF, it is WHEN, but it will be on YOU as the mud slides and bury these homes along the road below it. You know, the builder is just testing you to see how much he can get away with at Malibu's Building and Planning. With all the distractions from the fire, I bet they thought they could get this through because everyone is distracted with the fire properties.

Deny any/all building on the above property. Keep it stable, leave it alone.

Dear Planning Commissioners:

There are numerous objections to raise against this ill-advised project.

•Blocking view corridors.

•Extreme height of proposed wall and planting of trees and foliage to further impact views.

•Unstable hillside jeopardizing the homes and lives of Malibu residents on Bayshore and Malibu Road.

•Circumventing of Malibu codes and setting these egregious precedents for other real estate speculators.

•The overbuild in square footage based upon the area's that are unbuildable on the property?

•The stream, that potentially could become a river, that flows out of the mountains through the outer edge of this property.

Realtor's mention Richard Weintraub is a local and should be afforded special privileges. I on the other hand find the aspect of a local resident purposely causing harm to his fellow residents by an over-designed, variance thirsty property for greed to be what is unconscionable.

Furthermore, he has listed
the property for sale and desperately needs approved plans from the City of Malibu to maximize his profits.

Thank you for your time and attention to this matter.

Sincerely,

Lynn

Honorable Planning Commission,

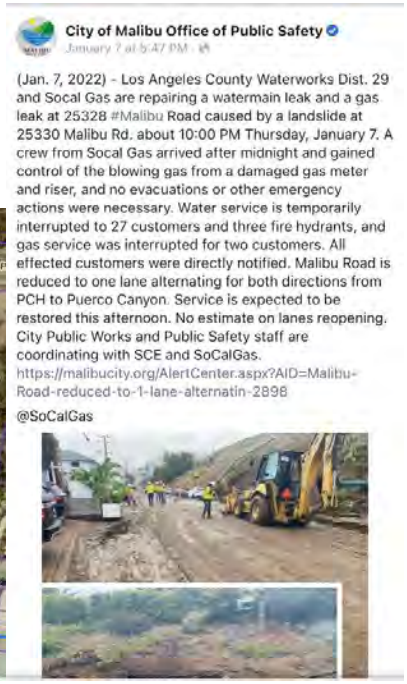
RE: 25200 Pacific Coast Highway, Coastal Development Permit No. 19-012

Malibu Township Council has been advocating for responsible development and protecting our natural, rural environment in Malibu since 1947.

These are reasons that the Planning Commission's decision on this project should be postponed.

1. The applicant should be required to redesign this project so that all structures are invisible from PCH.
2. Before you approve this project the applicant should come back with a revised landscape plan showing none of the vegetation will be at maturity above the height of the highway.
3. The berm along this property seems to have risen higher over the last few years and vegetation has been allowed to grow further blocking the beautiful scenic view from the PCH. This should be double checked for any illegal grading as requested by Mayor Pro Tem Silverstein at the last City Council meeting.
4. Landslide studies must be completed in the geotechnical review for this project prior to approval since several landslides have occurred adjacent to this lot AND it is entirely in the Malibu Road Landslide Assessment District and as new development needs to be deemed safe or not to build as NOTHING has ever stood on the lot. NOTHING in the staff report or review mentioned this at all. How can a project of this size and width be allowed in a landslide area when a similar project - Rappaport - caused landslides in a non-landslide area further on Malibu Road? There are several unbuildable lots just below this project on Malibu Road due to landslides. See p. 9 & 10 of this Assessment District report - under 5. Emergency Services: https://www.malibucity.org/DocumentCenter/View/31025/FY21-22-Annual-Report---Malibu-Road-AD-98-3?bidId= It states that the slope has been steepened by erosion and may be subject to further erosion and thus should be treated as a Coastal Bluff as there are only beachfront homes and some empty lots by the beachside in front of this bluff.
5. A broken 20-inch drainpipe that goes right through the middle of this lot has not been dealt with by the City, County or Caltrans or any private parcel owners and continues overflow, flood and erosion of the slope and the immediate areas causing several adjacent slides over the past decade. At the very least it should be mandated that the applicant repair this if he intends to proceed with the project. This would require finding out who is responsible for the pipe and receiving the appropriate permissions.
6. Clarity is needed on how large the septic tank is. The staff report on p 7 states that it will be 1500 gallons for a 7+ bedroom, 11+ bathroom complex with 5 pools, etc. as per the plans. Yet there is an OWTS plan buried within p 173 stating a 7540-gallon tank for a 6-bedroom, 12-bathroom residence incl guest house? If it is a 7540-gallon tank it should be reduced in size. Between this much effluent and excessive irrigation for over 70 trees, etc. planned this can put the landslide area in jeopardy from this one home which already has an eroding unstable slope. Excess water causes erosion and further landslide risk so safety findings cannot be made.
7. Why are more than four 6 ft back-to-back retaining walls proposed without a variance?
8. Here neighborhood standards for Malibu Road and Bayshore Drive needs to be accounted for - this project is more than 5 times the average size of the homes there and completely out of character of the remaining homes in the same assessment district, and NONE block the scenic ocean view as this one proposes. Cher's house nearby is NOT in the assessment district and was built before Cityhood so cannot be compared and this finding can't be made for residential development standards.
9. We were wondering why this project is a priority and not given more scrutiny over L4L fire rebuilds. Especially when it is obviously for a spec house as it is already being advertised for sale - https://www.weintraubre.com/projects/coleava/

Please either postpone a decision or deny this project until further information and studies are completed to ensure the public's scenic views are protected and that public safety is assured.



Thank you,

Jo Drummond
On behalf of Malibu Township Council

Established to promote, stimulate and further community spirit, to sponsor any project of merit that may benefit any district of Malibu Township, to foster and promote the cultural development of the Township; and in general, to do all things that tend to build and uphold the character of this residential area.

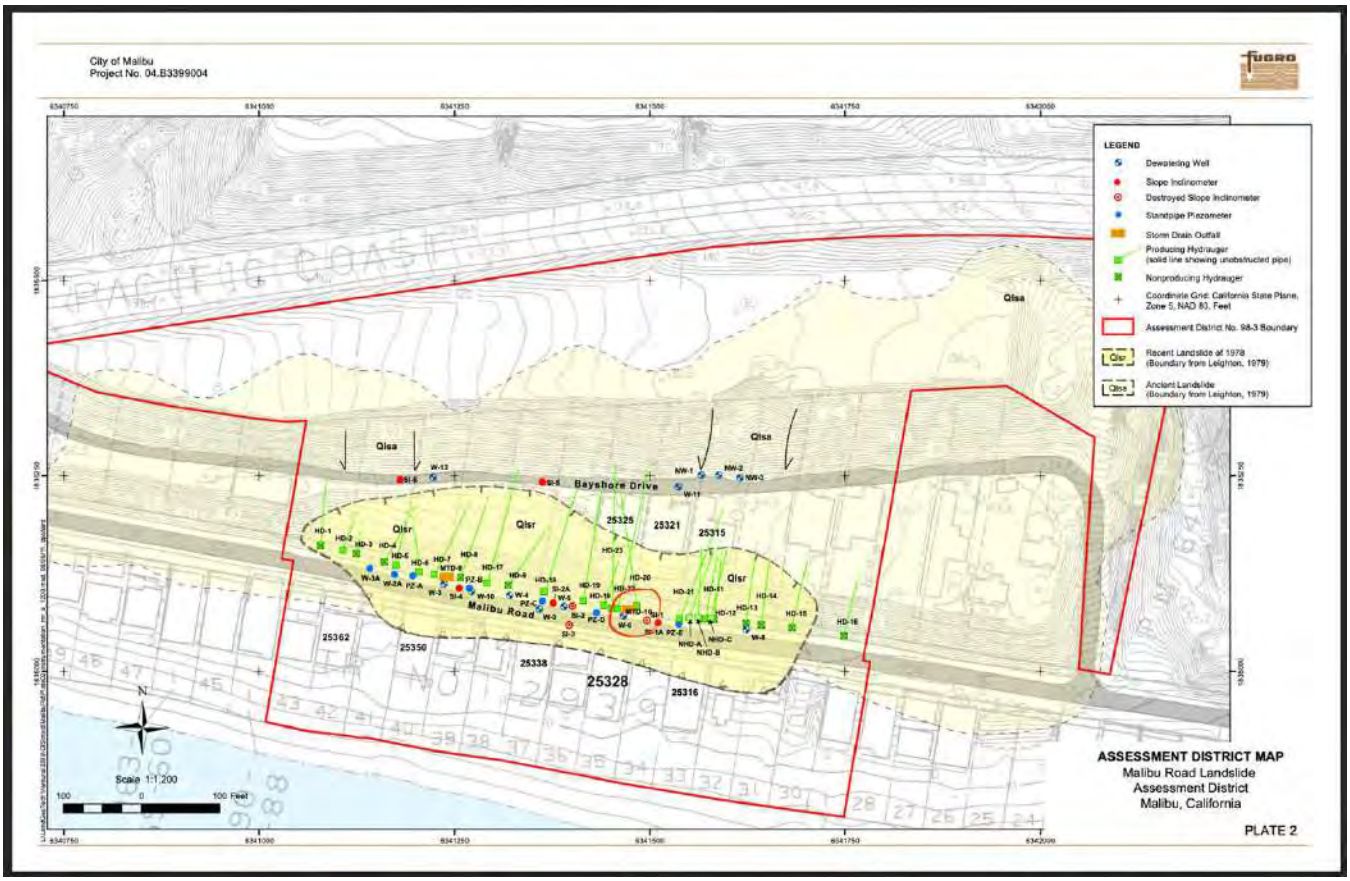
— Malibu Township Council Articles of Incorporation, January 2, 1947

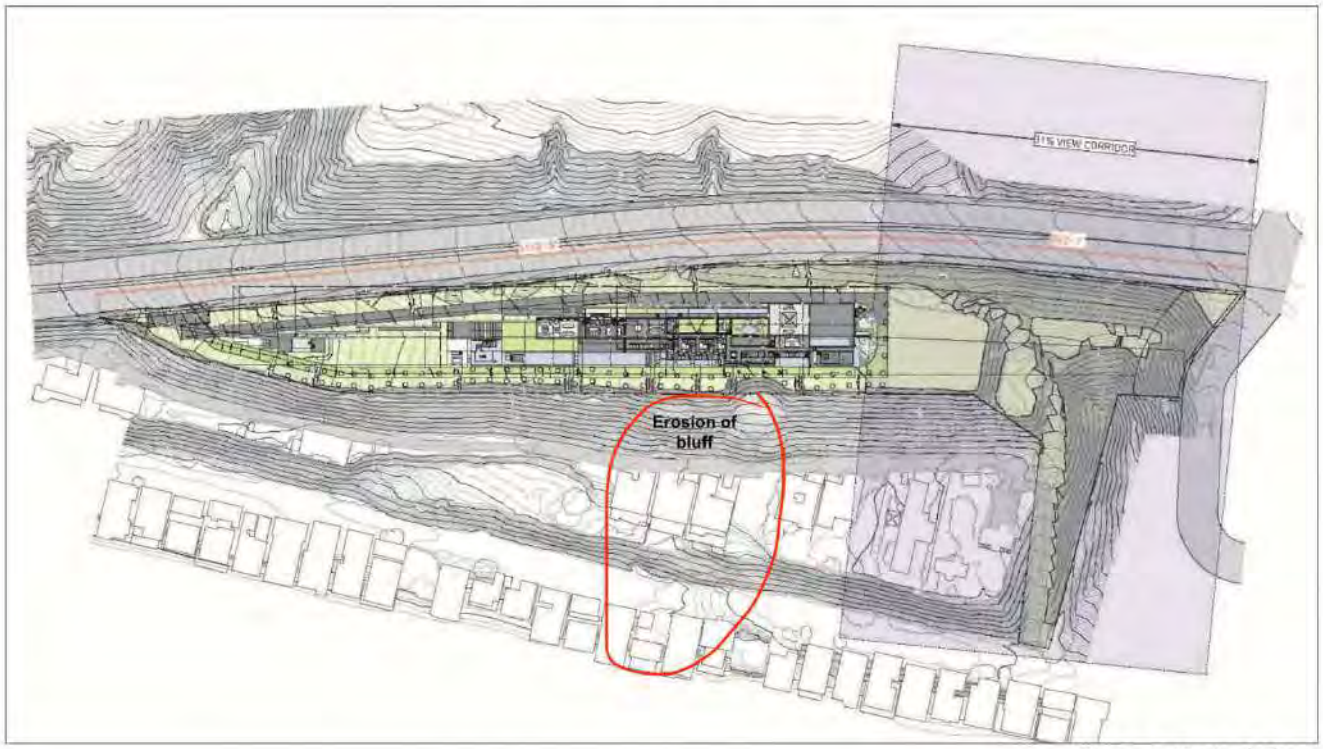
5. Emergency Services

On the evening of January 6, 2021 an uncontrolled discharge from a watermain break near culvert MTD-10 caused erosion and partial slope failure from MTD-10 westward approximately 100 feet. The waterline is owned and maintained by Los Angeles County Waterworks District 29. Yeh was contacted by the City on January 7, 2021 and dispatched personnel onsite on January 7 and 8 to investigate potential impacts to district facilities. Yeh personnel surveyed slope inclinometers and did not

observe shear type movement. Yeh personnel noted that several district facilities were damaged or buried and after the event, maintained communication with the City and Water District to confirm repairs and recovery of the impacted assessment district facilities were completed. It should be noted that the slope behind MTD-10 and approximately 100 feet west remains in an over-steepened condition by the erosion and the slope may be susceptible to additional or more frequent erosion.

Malibu Road Landslide Assessment District Includes this entire parcel





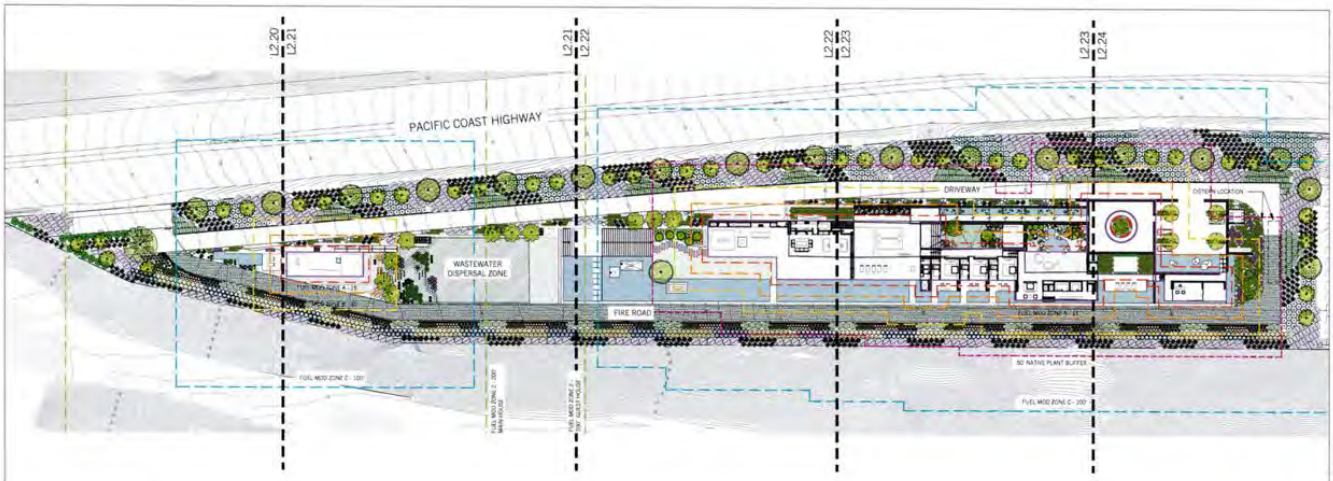


Figure 2 –Proposed Site Plan

Source: Project Plans

Please note at least 50 trees along the berm/PCH side that grow up to heights of 50 feet. This goes against the condition of landscaping not blocking any scenic views.

From: Tiffany Murray
To: Planning Commission; City Council
Subject: 25200 PCH and request for 21 july hearing postponement
Date: Saturday, July 19, 2025 5:14:41 PM

Warning: Unusual sender [redacted]
You don't usually receive emails from this address. Make sure you trust this sender before taking any actions.

Dear City Council, and Planning Commissioners.

Given the significant number of residents away during summer, advancing a project of the scale impact without full public presence and input is simply unreasonable. We are formally requesting this item be postponed to allow for proper review, community input, and accountability. At a minimum, this must be delayed beyond July 30.

With full regard for the seriousness of the issues involved, we are reiterating the following—with greater urgency:

- The leaking pipe running through the property to 25328 Malibu Rd remains unaddressed, despite being reported over a decade ago. Caltrans has acknowledged responsibility but has taken no action. This poses an ongoing threat to hillside stability.
- Recent slide activity in this exact area was already noted by the city; yet no remediation has occurred—this is unacceptable given the known risks.
- We need a clear answer from Caltrans: Was the berm behind the property raised in recent years? If so, was this work permitted? The height increase appears significant and unexplained.
- This project has been marketed publicly as if approved, despite no proper public notice and very limited community outreach. Many residents were never informed or invited to participate in the planning process.
- The proposed design is massive, visually obstructive, and fundamentally out of step with Malibu's environmental goals and

neighborhood standards. Over 80% of the public scenic view along PCH would be lost.

- At a time when Malibu must focus on rebuilding homes for fire-affected families, this speculative project should not consume Planning’s time or resources.

We are trusting you to provide a timely and transparent response.

Sincerely,

Tiffany Murray

To whom it may concern… I have lived in Malibu and have enjoyed the scenic route from PCH for years. It would be criminal to put a house on the Bluff next to Chers. You would ruin so many people's enjoyment going down that hill to Point Dume. Please vote against putting any type of structure there on the bluff next to Chers. Thank you.

Hi Allison. It was pleasure to talk to you. I will be out of town as I have mentioned for the hearing. My main concern is not to have any pool or any structure above 25423 and 25411 Malibu rd. We have a subsurface septic irrigation dispersal field right below proposed guest house and pool. And it cannot be disturbed in any way. Other than that I have no objection to the project. Thanks
Albert

Re: Coastal Development Permit (CDP) #19-012, Conditional Certificate of Compliance #21-004 and lot merger #24-002

Dear Planning Commissioners,

I am a resident neighboring the proposed development at 25200 Pacific Coast Highway and wish to express my support for the new home project, provided a critical issue is resolved. The CalTrans drain, located on both the north and south sides of Pacific Coast Highway, is damaged. During rainfall, water runoff enters the drain, flows beneath the subject property, and results in mud spilling onto Bayshore Drive through an opening just west of my property. This is particularly concerning given the history of landslides on our street and a past lawsuit involving the late Steve Karsh and CalTrans regarding this same un-repaired drain.

I fully support the proposed project, contingent upon the repair of the damaged CalTrans drain to address these safety and environmental concerns. Thank you for your attention to this matter, and I look forward to the project moving forward with this necessary improvement.

Sincerely,

Alessandro "Sandro" Dazzan

Funnily enuf, Malibu Township Council just emailed me that this meeting is set for a sneak meeting on July 21, 2025.

As a very concerned Malibu Road homeowner (my thread below is querying the landslide issues dating all the way thru 2024), we'd like to request a postponement so more of the public can attend.

Thanks so much. If you scroll down to pictures, you'll see impacts from 2011 landslide caused by Rappoport's underground garage filling up w. water and affecting 3 PCH properties as well as 4 or 5 on Malibu Rd/Puerco Cyn Rd across from my place. The whole hill had to be encased in industrial-grade plastic to protect it from rains.

To: Steve Uhring <SUhring@malibucity.org>, <BSilverstein@malibucity.org>, Doug Stewart <DStewart@malibucity.org>, Marianne Riggins <mriggins@malibucity.org>, Haylynn Conrad <HConrad@malibucity.org>, <CBond@malibucity.org>

As this land issue was brought up by Jo Drummond in the last City Council meeting, I wanted to point out that the story poles which were blown about in the winds leading to Palisades Fire, seem now to be re-erected even *higher* than the previous ones. Could someone please check on the architecturally-stated heights and compare?

Subject: Re: Story Poles by Cher's?
To: Steve McClary <SMcClary@malibucity.org>

Back to the story poles: my brother, a Malibu contractor, said he read thru all the plans, and NOT TO CODE is an 11 ft wall requested for PCH side of Weintraub's extended bluff house. Cher had to fight for a good long time for her 10ft wall, and pay $125,000 into a musicians fund after her *fait accompli*. The LA Times in 1991 said she'd hit a *wall* of resistance from the California Coastal Commission...They also ordered that an independent study be conducted to determine whether the septic system proposed for the property, which is "near" a landslide, would cause a geologic hazard.

"We're talking about a house that is close to the landslide and that is going to have a lot of bathrooms in it," commissioner Madelyn Glickfeld said. "It's not going to have the typical sewage effluent of the typical 3,000-square-foot home."

Apparently her wall was 3 feet above zoning, so that puts Weintraub another foot over that. https://www.gettyimages.com/detail/news-photo/cher-lived-in-this-home-in-2003-she-got-away-with-building-news-photo/881199978
As you know from my previous posts about caissons (April 20 & May 2)

the Weintraub property IS on a landslide.

As noted previously (and copied below) this is a massive project that requires more review and simply begs for the people with the most knowledge of why it should not be built as proposed to be heard. That said, for the record please note that I, as an individual, and the Malibu Township Council, of which I am president oppose the proposal as presented. Please stop this oversized, risky build that needs more vetting before coming to the Planning Commission. Fire rebuilds in this city should be prioritized over these maxed out projects that go against everything our vision & mission statement stand for.

Thank you for your attention to this matter.

Re: 25200 PCH item 5A

Date: 7-21-25

Honorable Members of the Planning Commission:

I can remember the first time I saw the view this proposed development at 25200 PCH will destroy forever.

It was the 90's. I was a young landscape architect driving from LAX to my client's property in Montecito. It took my breath away. I even called my father to tell him about it. (The only other time I called him while on business was from a train speeding past Mt. Fuji.)

Now that I am a Malibu resident, I have seen how the Pacific Ocean views along PCH have been blocked little by little, project by project. Structures. Trees. Walls. Fences. Gates. All conspire to prevent the public from enjoying the absolutely stunning views.

There is a reason why **the Pacific Coast Highway is a DESIGNATED SCENIC HIGHWAY**.

It is Malibu's responsibility to preserve and protect these views.

CC: Planning Commission, PD,

Recording Secretary, File

Date Received 7/21/25 Time 7:30 AM
Planning Commission meeting of 7/21/25
Agenda Item No. 5A
Total No. of Pages 2

Please DENY This project.

This project is not respectful of Malibu's Vision and Mission Statements.

This project is disrespectful of everyone's appreciation of the scenic views - visitors and residents alike.

The project is excessive in size. Applicants are not automatically guaranteed the maximum Total Development Square Footage. Planning Director Richard Mollica previously directed Planning Commissioners: **"As Commissioners, if you feel you cannot make the findings and you would like to see a smaller home on the site and you feel it is out of character …that is where the Commission has its discretion here. You have the ability to say you can't make the findings. It is out of character. As a Commission you can always ask for less."**

The walls along the PCH slope are too high. The max wall height is 6ft and should be staggered at least 6ft apart.

The project consumes too much water – the pools are not even covered which wastes precious water. Malibu needs water in the event of another fire. Think about what happened when the Pacific Palisades reservoir was empty. The water tank on Busch was empty before the Woolsey Fire even reached Malibu Park.

The plant list should be revised for height and flammability. For instance, bamboo is flammable and could disperse burning cinders upon the landscape and houses below. The placement of large-growing trees such as *Quercus agrifolia* which grows to 70 ft. will block the views

This precarious project would loom over many residences. Please request another geology report. And coordinate with Public Works concerning possible leaks from a CALTRANS pipe before reviewing this project.

Thank you for your consideration.

Re: Coastal Development Permit (CDP) #19-012, Conditional Certificate of Compliance #21-004 and lot merger #24-002

Dear Planning Commissioners,
We live at [redacted] Malibu Road and our home is directly beneath the subject property on a bluff overlooking Malibu Road. On "our" bluff, we are very conscious of our neighbors and their properties. Our concerns are that we are protected from any potential landslide, that drainage from either rain, landscape watering, or runoff from PCH; and that their septic system doesn't compromise our property in any way.
From what I've seen, the project looks well thought out and will be a good addition to our community.
Please issue their requested permits so that they can complete the building of their beautiful new home and improve our neighborhood's aesthetics. Mr. Weintraub has proven himself to be a good and caring neighbor for several years by maintaining his vacant property and biannually cutting back the overgrowth of weeds to meet the requirements of the fire department.

Sincerely,

Chris & Pat Reed

>
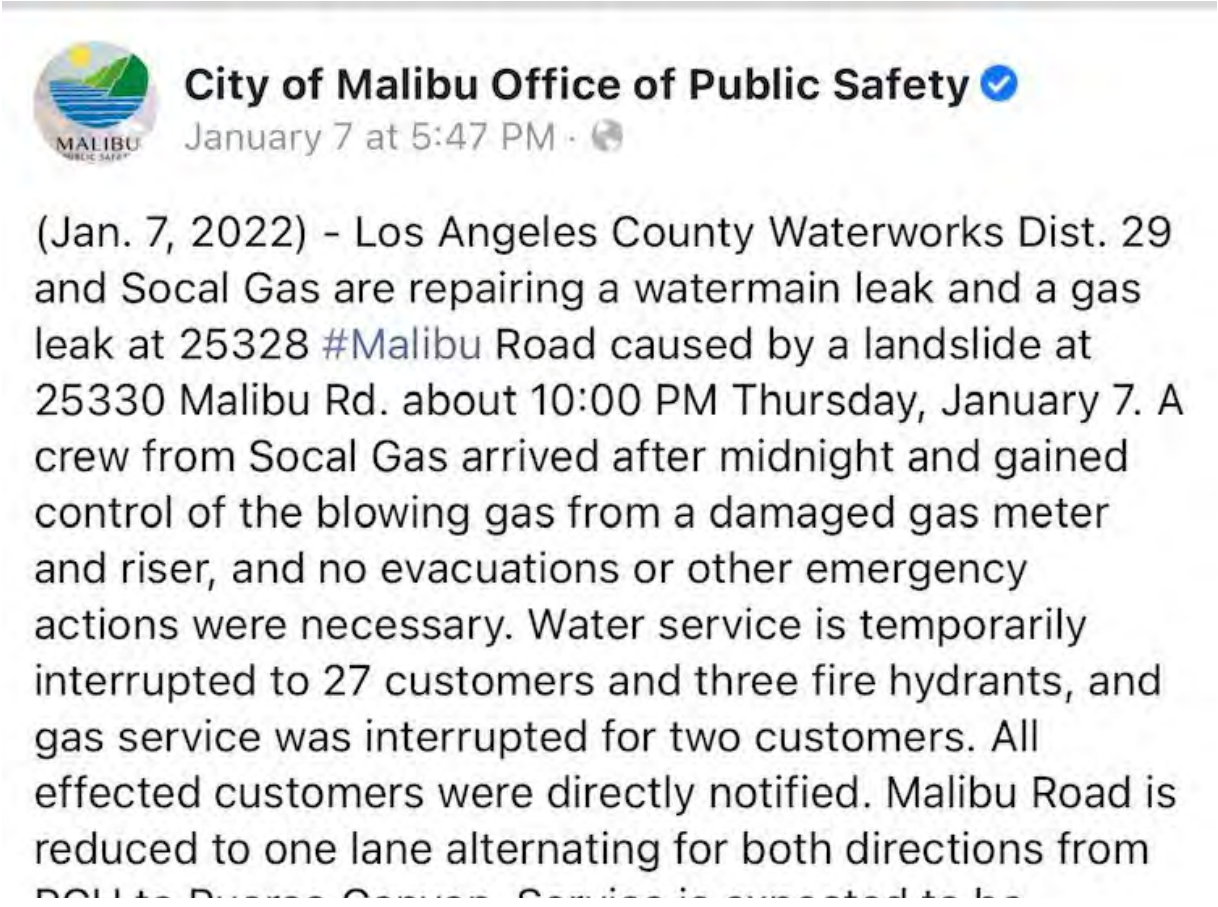
> As I requested in my email from last Friday, we earnestly request that this item be continued to the next Planning Commission meeting after July 30.
>
> 1. On behalf of MTC I would like to request information from our public works department regarding the slope/bluff/hillside where this project is proposed. It was apparently recently on one of the latest public works commission agendas where some slide activity there was reported. There have also been slides there in the recent past (see attached City of Malibu Public Safety Notice).
>
> 2. It has been investigated several times yet without ANY remediation of a pipe that constantly leaks and overflows that goes directly through this property down to 25328 Malibu Rd (same area where previous slides have occurred). This was originally reported over 10 years ago by then public works commissioner, Jim Palmer. Jefferson Wagner also has informed the City of this several times. I personally followed up on this with Caltrans and public works in September 2022 and discovered finally that it was under Caltrans responsibility yet they have taken ZERO actions in repairing this pipe that is risking the stability of the entire area. Pls see the first email and photos attached that I sent the City and LADWP to follow up on this unmitigated slide area.
>
> 3. We also would like to consult with Caltrans if they indeed did increase the height of the berm in the last year or so. It has definitely become higher over the last few years and we need to know if, when and why it was completed and if it was illegally graded, increasing the height of this berm.

4. We have been asking about this project when the original story poles went up with no info given to us and only a handful of people were invited and accepted the city planning's invitation to see the plans about a year ago. No other information has been given yet this property is already being advertised for sale as if it's been approved -

https://www.weintraubre.com/projects/coleava/

5. A project this size, mass, etc. is not in line with our Vision & Mission statement nor is it the least environmentally damaging or anywhere in the neighborhood character of the area. With its current ongoing extreme horizontally long design it plans on blocking over 80% of the public scenic view along PCH and needs much more notice to the public.

6. This precarious project should NOT be the focus and a distraction of our planning department during this time where we need to rebuild 1/4 of all of our homes in Malibu back.



7. Most residents leave the city for vacation during the month of July - for instance my family is traveling to London, England tomorrow afternoon moving our daughter there and will be back in two weeks so this should be scheduled during a time when families are home in the fall.

Please advise on if and when this application/item can be postponed to after July 30 at the very least.

Thank youuuu, Jo

Warning: Unusual sender [redacted]
You don't usually receive emails from this address. Make sure you trust this sender before taking any actions.

Dear Yolanda...

I will be forwarding you emails sent back and forth from Public Works back in 2022 (see first chain below) regarding the over one decade **broken Caltrans pipe that has been leaking and runs directly through** the center of the property at 25200 PCH that is scheduled to be heard on Monday. There is still an ongoing dispute between the City, County and Caltrans where the MUCH NEEDED repairs have still not been completed.

Until this is sorted out this scenic view blocking project with its **11+ Proposed bathrooms and 7+ bedrooms** CANNOT be approved by planning or planning commission. This is why I hope that you can coordinate proper communication in the future between Public Works and Planning so important facts like this are not continuously overlooked for the stability of new projects.

If Public Works was ALSO consulted regarding our fire rebuilds in Big Rock and beyond then we would not need such EXTENSIVE geo studies for our lots where we are simply trying to rebuild what we had - they could simply be stamped approved as they are all on lots that have never moved. City Public Works commissions extensive geo studies of our area all year long and reports annually on our active and properly working dewatering system that can settle any issues. The landslide itself 300 feet below has barely moved a few millimeters over decades because we are on top of the dewatering system and massive NEW development has NOT occurred over the last decade thanks to prudent building and safety practices and responding to neighborhood concerns on questionable larger cliffside and vacant parcel projects. Pls enforce that our burned down homes are NOT new development and use discretion wisely here and fast track their approvals as mandated by the Governor's recent Executive Order N-29-25 on local agencies determinations in Paragraph 4. This has been an ENORMOUS road block to our rebuilding from both Palisades and Woolsey. Fire does not affect the **land** where our homes have stood for decades.

Please put our fire rebuilds as a priority above such at risk, HUGE projects such as

Hello Jo, apologies for the delayed response!

We have completed our investigation and according to our as-built plan there is an existing 20-inch pipe upstream of the Malibu Road inlet (downstream of PCH); we have determined the *20-inch pipe line,* connected to our MTD 622 line A (at 25328 Malibu Rd.), is Caltrans owned. This section of pipe, shown below in red, collects drainage from PCH and is to be maintained by Caltrans. The Malibu Road inlet, 18-inch RCP, and MTD 622 line A, are all Flood Control owned.

Our recommendation would be to request as-built drawings from Caltrans for PCH, to solidify ownership of this existing 20-inch pipe (between PCH and Malibu Road inlet).

Thank you,

Any update William?

Thx! Jo

On Apr 25, 2022, at 12:33 PM, Arthur Aladjadjian <aaladjadjian@malibucity.org> wrote:

Good afternoon William,

We recently did a survey of the area in an effort to identify ownership of the stormdrain facilities in the area. The pipe from land side of Malibu Road to the outfall on the ocean side appears to be marked as a County drain. However, the attached plan view “Section B-B” from our survey records shows another pipe (owner not identified) between the county catch basin on the land side of Malibu Road going uphill towards Bayshore Drive. We need some input on who owns the pipe connecting between land side of Malibu Road uphill towards Bayshore Drive.

Our Survey records could not verify any stormdrain easement/ownership between Malibu Road and Bayshore Drive.. and up to PCH. Any input is much appreciated.

Any feedback is much appreciated.

Thank you,

Arthur

Dear Patrick,

My dad wanted to know if it Is it possible for you to locate a plotted easement on APN 4459-014-004 This easement is in reference to an underground drain by the county of los angeles or Caltrans state of california easement. Any help would be greatly appreciated.

Best Regards,

Jonny

Hi Yolanda...here is the last email regarding the broken drain pipe that was never formally responded to below. I have followed up verbally at almost every Planning Commission meeting since I started in 2021 and this still has not yet been repaired.

Perhaps Arthur and Brandie can follow up with Caltrans again now that this project has come up - nothing can be approved on this lot until this pipe at the very least is taken care of. As far as we are aware Caltrans is still denying responsibility. Given the instability in the area that has been caused by this pipe that leaks when it rains the effluent coming from such a large project should definitely be considered and adjustments made to the current plans for the large heavy massing taking up almost the entire parcel and water usage. As there are no structures between a majority of the property and Malibu Road along the beach it should also be considered a coastal bluff and restrict development accordingly. One of the beachfront lots also remains empty and unsellable as it was taken out by a landslide from where this project is proposed. See images below.

Pls also note in the images that compare the lot via the first google earth image to the massively long project designed by a Miami architect, that is approaching over 1100 ft in length along PCH. It plans on blocking the views from PCH on the entire 1700+ ft length of the property with 20-50ft tree plantings also not mentioned in the description of the project - see below. NONE of these should be allowed per view ordinance and for fire safety. As well, no one wants a wall to block the scenic ocean view enjoyed by all visitors and residents currently.

There is also a GLARING error on p 7 of the staff report e. the septic tank is over **7500 gallons NOT 1500 gallons**. This needs to be corrected for the public also so justifies a postponement as well. We ask that the City state publicly exactly how many trees and what heights are proposed for them along the PCH side also. The individual lots that this one lot has illegally combined thus far should also be split into

City of Malibu Office of Public Safety

January 7 at 5:47 PM ·

(Jan. 7, 2022) - Los Angeles County Waterworks Dist. 29 and Socal Gas are repairing a watermain leak and a gas leak at 25328 #Malibu Road caused by a landslide at 25330 Malibu Rd. about 10:00 PM Thursday, January 7. A crew from Socal Gas arrived after midnight and gained control of the blowing gas from a damaged gas meter and riser, and no evacuations or other emergency

and riser, and no evacuations or other emergency actions were necessary. Water service is temporarily interrupted to 27 customers and three fire hydrants, and gas service was interrupted for two customers. All effected customers were directly notified. Malibu Road is reduced to one lane alternating for both directions from PCH to Puerco Canyon. Service is expected to be restored this afternoon. No estimate on lanes reopening. City Public Works and Public Safety staff are coordinating with SCE and SoCalGas.

Hi Arthur! Hope all is well…

Do we have an update on the Malibu rd pipe repair that's desperately needed?

Jim Palmer checked the broken pipe after all the rains and is still not fixed. It still floods the road and creates a huge muddy mess.

Please advise on where we are at with this repair.

Thanks very much! Jo

Good afternoon Jo,

Weekend was nice I hope you enjoyed yours as well!

Appreciate your follow up. We had to elevate this issue to upper management at Department of Transportation. For that reason, Caltrans Deputy District Director of Maintenance has a team currently collecting information to share their findings on the subject matter. After a preliminary review, they indicated it may not be their facility but will wait to gather all the facts and follow up with us on what their records show.

You are also welcome Submit Customer Service Requests through their online portal to help push this matter to further document maintenance request and also receive follow up updates (i.e. used for storm drains issues, potholes, down signs, brush clearance, signal issues, striping, etc.) …..
https://csr.dot.ca.gov/index.php/Msrsubmit

Thank you,

Arthur

Good afternoon Jo,

Thank you for your email. Yes, we have followed up with the Caltrans maintenance team on several occasion and reached out again this week.

The Joint Public Works and Public Safety Commission meeting scheduled for this Thursday is to provide an update on Caltrans' Capital Improvement Projects (CIP), per the meeting agenda item. For that reason Caltrans CIP representatives attending the meeting will not have the information requested below that is related to their maintenance division team.

We will continue to follow up with Caltrans maintenance and anticipate an official response soon.

Have a wonderful day.

Arthur

On May 5, 2022, at 4:35 PM, Valerie A. Esparza (PW) <vesparza@dpw.lacounty.gov> wrote:

Hello Jo, apologies for the delayed response!

We have completed our investigation and according to our as-built plan there is an existing 20-inch pipe upstream of the Malibu Road inlet (downstream of PCH); we have determined the *20-inch pipe line,* connected to our MTD 622 line A (at 25328 Malibu Rd.), is Caltrans owned. This section of pipe, shown below in red, collects drainage from PCH and is to be maintained by Caltrans. The Malibu Road inlet, 18-inch RCP, and MTD 622 line A, are all Flood Control owned.

Our recommendation would be to request as-built drawings from Caltrans for PCH, to solidify ownership of this existing 20-inch pipe (between PCH and Malibu Road inlet).

Thank you,

Subject: [External] Need Help Locating a Plotted Easement on APN 4459-014-004

Dear Patrick,

My dad wanted to know if it Is it possible for you to locate a plotted easement on APN 4459-014-004 This easement is in reference to an underground drain by the county of los angeles or Caltrans state of california easement. Any help would be greatly appreciated.

Best Regards,

Jonny

Hi Commissioners,

I haven't read the staff report closely this time – not to my usual standard – but I did walk the whole site not long before the Palisades Fire, when it appeared the project would be imminently in front of the Commission. I'm qualified to make a few limited observations.

Recently I was driving up the PCH with a friend who knows Malibu well but hadn't been in town for a while. When we got to this site, they saw the story poles and exclaimed,

> "Whoa, they're building a strip mall there?!"
> I said, "It's a house."
> "You mean condos, right?"
> "No, one house."

Therein lies at least one rub. In attempting to spread a house out so thin as to avoid two stories, they've affected the entire view along that area. What makes the blockage of a "visually impressive" view significant is not simply the proportion of ocean or mountains it blocks from a certain spot; a little bit of blockage across that wide span of view can and does affect the entire view. It's hard to hide a really big spec house, no matter how it's shaped. Even the cover sheet of the Planning Submittal (at PDF 52) is a rendering "at dusk," such that the full width of the proposal can scarcely be seen:

(I saw something similar in an ad for the struggling NEOM resort in Saudi Arabia.)

The way it's arrayed on the lot doesn't account for the fact that the public views from PCH feel more significant closer to the west end of the lot, where the beach and Point Dume are more of what you're looking at as you drive west. In effect, the view corridor is on the wrong end of the lot. I understand there are some private views from Puerco Cyn Rd. that would be affected, but all things considered, the public interest is to be preferenced. Anyway, it looks like Puerco houses would see the structure no matter where it is on the lot.

The report doesn't mention that the project would be in full view of the public trails on MRCA land on the other side of PCH, accessed via the Sara Wan trailhead at Corral beach. Tucking the project back further on the East side *might* also help those views.

Evidently in an attempt to sink the structure from view, large retaining walls have been proposed between the structure and PCH. Someone sent me a link to the website for this spec house; it shows an oversize retaining wall on the north side, not part of the building structure. The Wall and Fence Plan A (at PDF 61) show several lines of 12 ft "building walls" in addition to multiple retaining walls of unspec'd height. On that sheet to the left of the vertical "match line" there's an area where four walls are staggered, one above the other. Recall that retaining walls, unless they are integrated in the building, can be a max of two 6ft walls staggered at least 6ft apart. For a building wall, you get one wall of 12 ft max. So that one spot looks like it could be impermissibly stacking as much as (12+12+6+6) 36 ft of wall going up the slope between the structure and PCH.

Beyond that, as others will doubtless point out, this area has geological issues. The setting is right in or adjacent to a known active slide. That makes the over-height walls not only impermissible, but imprudent.

Date Received 7/21/25 Time 7:30 AM
Planning Commission meeting of 7/21/25
Agenda Item No. 5A
Total No. of Pages 2

CC: Planning Commission, PD,

Recording Secretary, File

From a land use and traffic perspective, the analysis has not considered the small shopping area proposal that has been developed for the NE corner of PCH and Puerco Cyn. I don't know how active those plans are currently – the developer showed them to me some time before Covid hit – but there could be interactions associated with that intersection to be accounted for (recall that CEQA cares about *potential* impacts too). All traffic to the west from the current project site would first have to turn around at Puerco.

More generally, consider carefully the interactions with freeway-speed PCH traffic there. Those artificially high berms could block sightlines, making egress unsafe – especially because merging onto the PCH you'd be driving uphill, slow to accelerate to traffic speed (even if the owner drives race cars, their tradies will have trucks and panel vans).

Finally, this one feels like one that could get sent up to Council, no matter which way you decide it. So, when there's a debate about some aspect, there's little need to argue; just be sure to get all your thoughts in the record.

Best,
K

Subject: Request for Postponement of Upcoming Hearing - 25200 Pacific Coast Hwy / CDP 19-012
Date: Saturday, July 19, 2025 4:59:29 PM

External sender [redacted]
Make sure you trust this sender before taking any actions.

Subject: Request for Postponement of Upcoming Hearing CDP 19-012

Dear Planning Department Staff and Yolanda Bundy,

I'm writing to formally request a postponement of the scheduled hearing regarding the proposed development at 25200 Pacific Coast Highway (CDP 19-012)

A project of this scale and mass appears to be significantly inconsistent with our city's Vision and Mission statements and is not environmentally optimal in its current form. The design—particularly its long horizontal footprint—is out of character with the surrounding neighborhood and poses a major impact to Malibu's public aesthetic. The view from PCH into the bay is iconic, and must not be blocked. I can't believe anyone would disagree with that.

Based on current renderings, it would obstruct more than 80% of the scenic view corridor along Pacific Coast Highway, a protected and cherished public asset. The community deserves more notice and opportunity to respond.

Additionally, I'd like to call attention to the historical slide activity in this area and further down Malibu Road, including a severe incident that occurred in my friend's backyard and blocked access to her garage for an extended period. The geotechnical risks should be reviewed thoroughly.

Given that many residents are out of town during the summer months, holding a hearing of this magnitude now limits public participation and due process. I respectfully request this hearing be rescheduled for a date after summer when more community members can attend, express their positions, and offer meaningful input.

Thank you for considering this request. We all share a commitment to thoughtful development and transparent decision-making, and I trust the city will honor the public's right to engage fully.

Sincerely,

Lonnie Gordon

To: Members of the Planning Commission
From: Malibu Coalition for Slow Growth
Re: 25200 PCH item 5A
Date: 7-21-25

Honorable Members of the Planning Commission,

Over the years little by little, project by project, protected public views along PCH are being blocked by structures and/or by landscaping.

This project's height and its landscaping as currently proposed would block an important and a stunning view from PCH, a designated scenic highway. This view needs to be protected and preserved.

Please do the right thing for Malibu Residents, commuters, and visitors alike who travel this portion of the highway by conditioning this project's development, including but not limited to , structures, retaining walls, fencing, the entrance gate be invisible from PCH.

This can be done by either reducing the height of the structures or grading the site low enough to prevent all structures from being seen from PCH. Both options are feasible.

It is more acceptable for the Commission to grant a variance for excessive grading to lower the elevation height of the site to prevent a view obstruction than to allow a permanent view obstruction of the current view from PCH.

Condition *31 states: To minimize bluewater view obstruction from PCH, on-site vegetation, including trees, shall be selected and located to have a maximum growth height at maturity that will not extend above the PCH grade or Caltrans berms, whichever is higher, and be maintained at this height. The Final Landscape Plan submitted for plan check approval shall reflect this requirement.* The existing landscaping plan in the staff packet has vegetation that doesn't comply with this condition and it would be prudent before project approval to require the applicant to submit a new landscaping plan that conforms to this condition for review by the Commission and the public.

CC: Planning Commission, PD,

Recording Secretary, File

Date Received 07/21/25 Time 7:30 AM
Planning Commission meeting of 07/21/25
Agenda Item No. 5A
Total No. of Pages 2

Let's be clear an applicant is not guaranteed the maximum TDSF or a desired height if public views are obstructed. A project can be denied or modified due to: visual impacts or a public view obstruction.

The following findings can't be made for the approval of a Coastal Development Permit:

Finding 1. That the project as described in the application and accompanying materials, as modified by any conditions of approval, conforms with the certified City of Malibu Local Coastal Program. Since this project will substantially block the public view, therefore, it doesn't meet the LCP requirement and this finding can't be made.

Finding 3. The project is the least environmentally damaging alternative. Our recommendation would be a less damaging alternative.

We respectfully request that the project be denied and redesigned to eliminate the obstruction of public views as seen from PCH by either reducing the height of the structures and/or by granting a variance to allow excessive grading to lower the elevation height of the site.

Thank you for considering our comments.

Dear Members of the Planning Commission:

I am writing as a nearby resident to express my support for the proposed home at 25200 Pacific Coast Highway, Malibu, CA 90265.

In addition to the important geological work being done to stabilize the hillside, I'm also impressed by the architectural design of the home. Combined with the geotechnical efforts, I believe this project will enhance both the safety and the aesthetic of the neighborhood.

I support this project and hope it receives your approval.

Sincerely,

Thomas Sawyer

Mr. Richard E. Weintraub

PO Box 6528

Malibu, CA 90264

Hello Richard,

We are the property owners at [redacted] and [redacted] Malibu Rd (Bayshore Drive) that have participated in the re-construction and sealing of the common driveway that runs from the bottom at Malibu Road to the top at [redacted]. We, jointly, would like to offer support of your proposed project above our properties.

As you are well aware, our neighborhood has had significant drainage and geological issues. We feel that the row of Caissons and soldier piles with the new project will significantly increase the stability of our neighborhood. This is obviously a tremendous benefit for us and for Pacific Coast Highway as well.

Another benefit is the project, as proposed, is currently one story. That helps reduce perspective from both Pacific Coast Highway and Bayshore Drive.

Thank you for your consideration.

City of Malibu Review Letter Dated November 11, 2022

Dear Mr. Weintraub:

Feffer Geological Consulting is providing this letter to address comments related to site stability. It is our understanding that a public comment has been raised which believes that previously approved reporting and analysis prepared by this firm does not meet an outdated requirement from an old code. An email from the City's contract geologist, Lauren Doyel, accurately summarizing the confusion is cited below:

"To be clear, this requirement is ONLY because several years ago the Planning Commission refused to accept that a newer methodology of computing the seismic factor of safety was adopted than that specified in the LIP under section 9.4.D in 2001 (OLD).

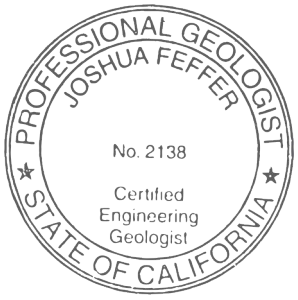
- Specified in 2001 under 9.4.D – use a seismic coefficient of 0.2, and set the cutoff at a factor of safety of 1.1 for seismic. This is a regional method.

- Updated in 2013, but never questioned by Planning commission until 2022 – use a higher seismic coefficient of 0.35 for screening, and set the cutoff at 1.0. This is a Malibu specific method, based on likely ground acceleration that covers most of the anticipated design-level earthquake events in Malibu.

Until we can get the guidelines updated this fall to match the LIP again, we are stuck with having to make the consultants compute the seismic factor of safety BOTH ways so Planning Commission does not reject a project based on technicalities. This has generally worked to date."

Bureaucracy aside, actual engineering and geologic analysis has been performed to develop our current conclusion regarding site stability. This firm previously prepared slope stability analyses to evaluate the overall gross static and seismic stability of the site slope. Our original seismic slope stability analyses evaluated the slope in accordance with

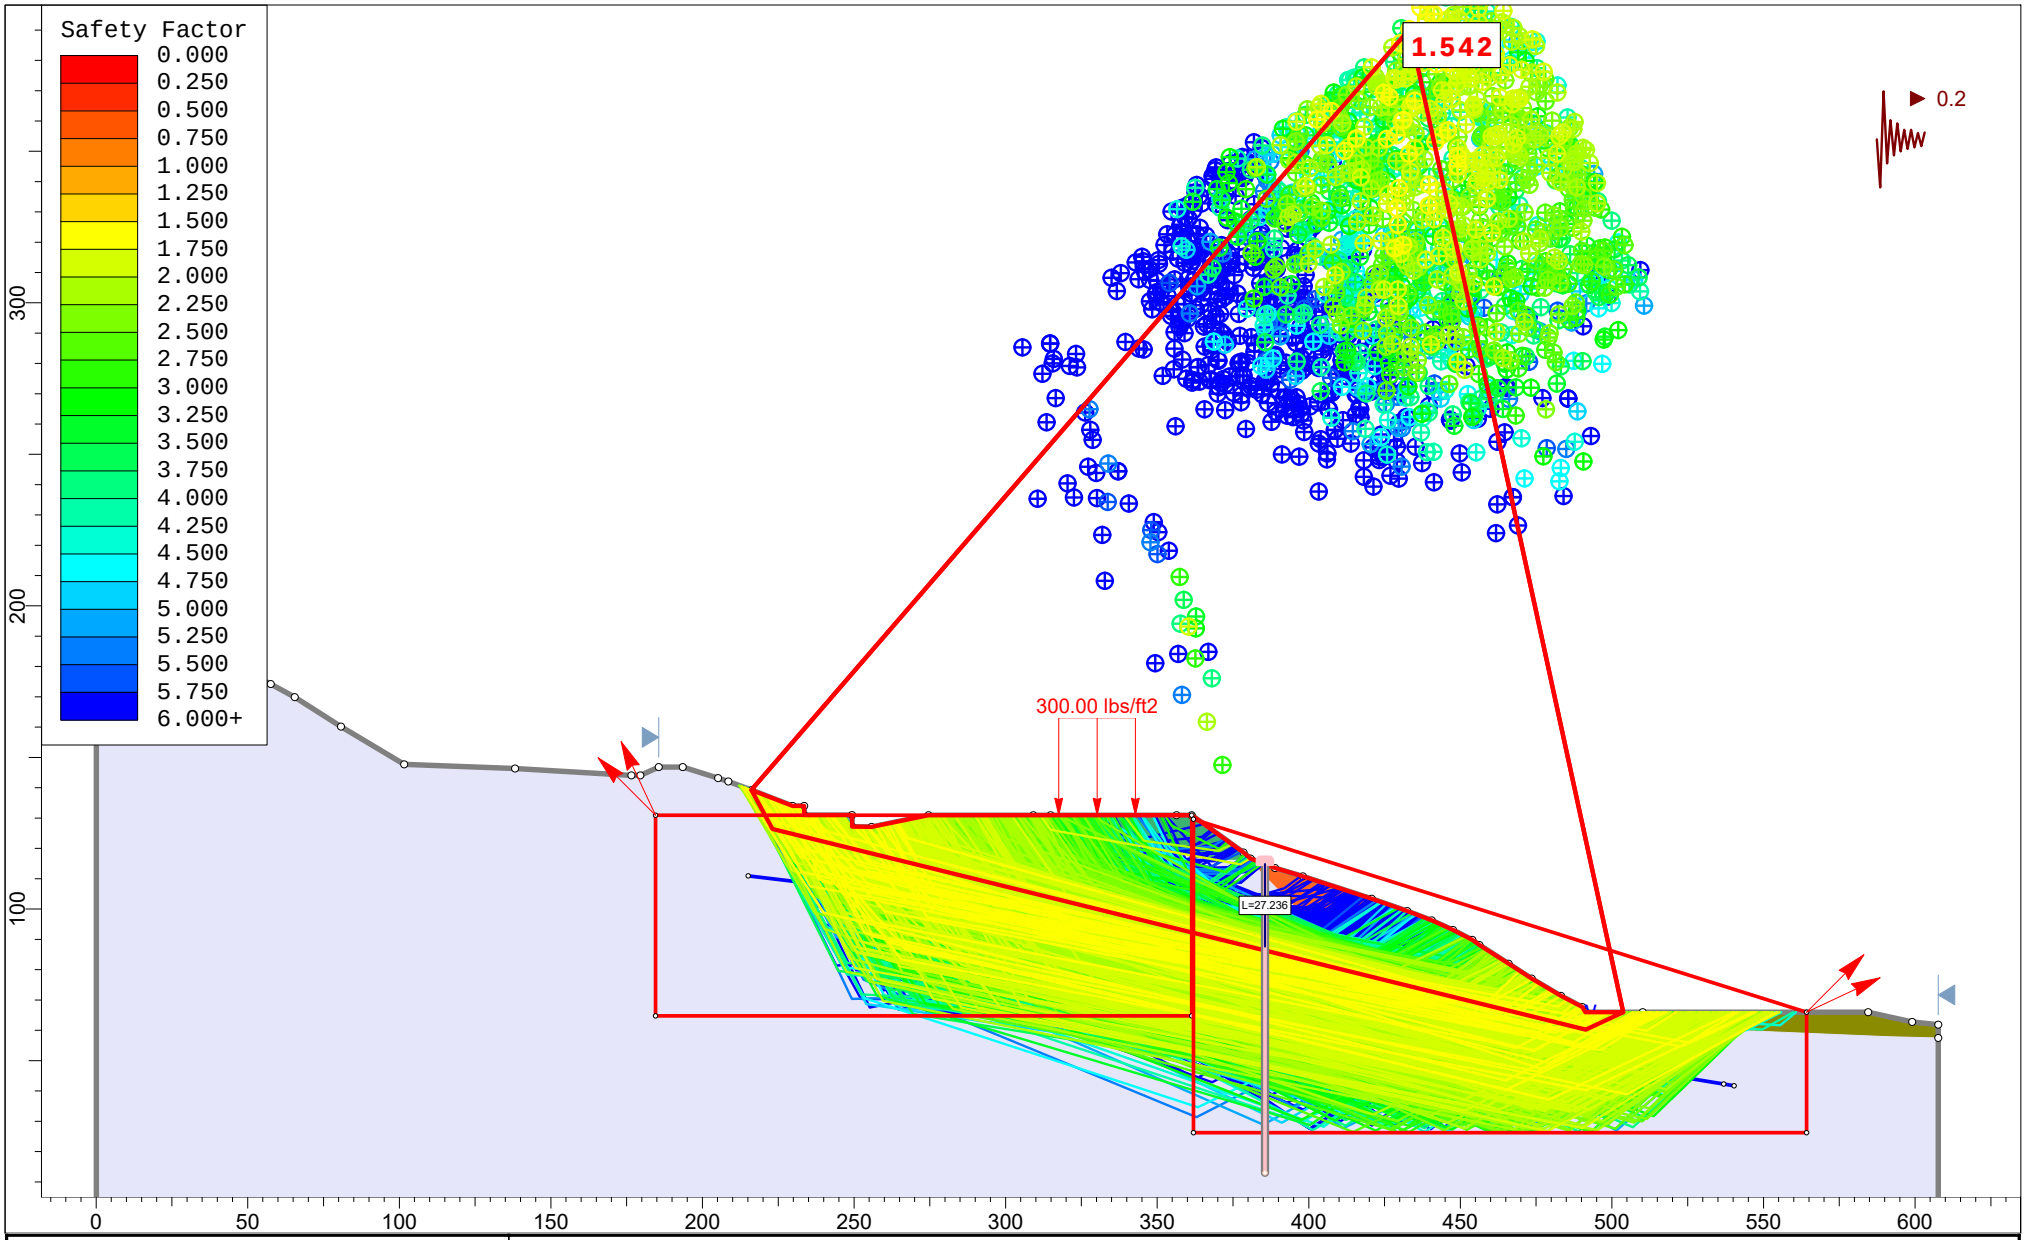
the City's 2013 Geotechnical Guidelines using a 0.35g seismic coefficient and a 1.0 factor of safety. Our reports and analyses were approved, having satisfied the City's current geotechnical guidelines.



To satisfy the outdated guidelines referenced above, this firm ran a series of seismic calculations using a 0.2g seismic coefficient and a 1.1 factor of safety. All sections analyzed returned factors of safety much greater than 1.1, meaning the recommended (and approved) stabilization design is over-engineered with respect to the outdated code. An exhibit for each slope stability analysis is attached to the back of this letter illustrating that the 1.1 factor of safety has been exceeded.

In sum, the stabilization system has been conservatively designed for worst-case scenarios under both static and seismic conditions. The proposed development and recommended stabilization system will not only create a more stable site than what currently exists but also create a safer development.

We appreciate the opportunity to be of service. Should you have any questions regarding the information contained in this report, please do not hesitate to contact us.



Sincerely,

FEFFER GEOLOGICAL CONSULTING, INC.

City of Malibu Review Letter Dated April 11, 2023

Dear PARPCH, LLC:

As requested, Feffer Geological Consulting is providing this letter in response to the referenced report by Pacific Coast Land Consulting. We appreciate the opportunity to be of service. Should you have any questions regarding the information contained in this report, please do not hesitate to contact us.

Sincerely,

FEFFER GEOLOGICAL CONSULTING, INC.

Joshua R. Feffer
Principal Engineering Geologist
C.E.G. 2138

Distribution: Addressee– (1)

INTRODUCTION

Pacific Coast Land Consulting (Ralph Jeffery) has brought up several points that we will refute in a line by line reply below. However, it should be noted that Ralph is questioning the judgement of both the City of Malibu's reviewing geologist and engineer, as well as the competency of Feffer Geological Consulting, Inc. Furthermore, many of the points that Ralph brings up have already been exhaustively addressed, explained, and analyzed within the 9 reports that were prepared by this office over a 5-year period along with the associated City of Malibu review and approval sheets.

A summary of the allegations is as follows and were taken from Ralphs 4.0 Conclusions of his letter:

ALLEGATION 1
The Feffer report for 25200 PCH does not address previously existing and well documented sliding.

RESPONSE
This statement is not correct, and it appears that Ralph has not reviewed the extensive discussion that has already occurred regarding this allegation. We recommend he familiarize himself with the documents produced by this firm.

As taken from the initial report that we wrote dated May 21, 2018:

3.5.1 LANDSLIDE DISCUSSION

Since the study of this property began in the Early 1960's ancient landslides have been inferred to underlie much of the subject site. A preliminary map produced by the USGS in 1961 delineated a slide area that surrounded most of the property and extended from Puerco Canyon as far west as Corral Canyon, and as far north as the Pacific Coast Highway.

Many of the previous consultants that have provided a geotechnical report for the subject property have built their conclusions around a combination of aerial photographs, geologic maps, and the geotechnical reports produced by Stone Geological (which later became Robert Stone and Associates), and the work of Leighton and Associates.

The first geotechnical investigation was conducted by Stone Geological (SG) and completed on December 11, 1962. The investigation consisted of 16 total bucket-auger borings within the vicinity and 8 along the subject property, which ranged in depth from 18 to 55 feet beneath the surface.

Stone Geological determined that the subject property was underlain by multiple intersecting ancient landslides that crossed the property line to the south, and continued beneath neighboring properties below the south-facing descending slope.

To delineate these slide boundaries, SG used a compilation of aerial photographs, geologic maps, and subsurface investigation. The borings were drilled and logged by the Donald R. Warren Company for Stone Geological.

Careful review of the report, and the data collected by SG, indicate that some liberty was taken in the interpretation of the data to identify possible ancient landslide boundaries and slide planes. Of the eight exploratory borings along the subject property, only one boring (SG B-4), contains a structural measurement that could potentially be identified as a feature related to landsliding. Interpretations of landsliding was based predominantly on the review of aerial photographs.

In April of 1965 Pacific Soils Engineering, Inc. (PSE) produced a landslide investigation of the subject property. A total of 17 bucket-auger borings were drilled to depth ranging from 5.5 to 64 feet beneath the surface. None of the boring logs, maps, or associated figures completed by Pacific Soils could be located in the records, and therefore locations of borings, findings, and interpretations cannot be verified.

In March of 1968 F. Beach Leighton provided a preliminary geologic review of the subject property. This preliminary review did not include a subsurface investigation, and therefore contains no data for comparison with past or recent explorations.

Additional work by Robert Stone and Associates (RSA) was conducted in May of 1969, once again in collaboration with Donald R. Warren. Of the 21 total bucket-auger borings completed, 10 were excavated on the subject site. Within the 10 borings conducted on the subject site, seven contained structural measurements, and none positively identified ancient or recent landslide planes or related features.

In 1979 Leighton and Associates (L&A) completed a final geotechnical investigation which included 12 continuous trenches on the subject property. None of the 16 bucket-auger borings were located on the subject site. Within the 12 trenches along the subject property only four trenches (LT-2, LT-7, LT-8, LT-11) identified features that could potentially be related to ancient landsliding. Fault trench 8 (LT-8), located near the eastern most edge of the subject site adjacent to the southern oriented canyon, was used in conjunction with our findings from the recent exploration to create an area delineated as a "No Build Zone" (Section 3.4.3).

Leighton identified several ancient slides on and in the vicinity of the subject site that were labelled as Qlsa 1-6. According to Leighton and Associates, none of these slides have exhibited any evidence of recent movement. These boundaries were ultimately used to delineate the landslide boundaries within the Malibu Road Landslide Assessment District report, which began in 1981. These landslide areas are discussed as follows:

***Qlsa1**-The majority of this ancient slide is located offsite the subject property and only partially affects the northeast corner. The ancient slide movement in this area is inferred to be towards the east and affects Pacific Coast Highway.*

Qlsa2- *This slide affects the easternmost portion of the subject site and is located within the thin layer of fill that was placed by Donald R. Warren circa 1952. Movement is inferred in an easterly direction towards the canyon located on the east side of the property.*

Based on the uncertainty of the landslide in the area of Qlsa-1 and Qlsa-2, and its depth and location adjacent to a canyon, we have established a "No Build Zone" as shown on the Geologic Map. This area will be isolated from the remainder of the subject lot by the installation of soldier piles.

Qlsa3- *This ancient slide, according to Leighton, has had no evidence of recent movement. Leighton's trenches LT-7 and LT-8 extended across the mapped edge of the slide and are described as "disturbed terrace" in contact with bedrock. This firm drilled borings FGB-1, FGB-7, FGB-8 and Trench FGT-1 within the delineated area of Qlsa3 and found no evidence of ancient sliding and simply a contact between the terrace and bedrock with no adverse orientations. Nonetheless, as discussed below, the entirety of the terrace (or ancient slide as described by Leighton) will be remedially removed and recompacted as a controlled and certified fill.*

Qlsa4- *This ancient slide is delineated by Leighton as a smaller slide to the west of Qlsa3. No concise evidence was found within Leighton's exploratory logs for the existence of this slide on the subject pad. Within Leighton LT-4, a questioned possible rupture surface was delineated. However this firm drilled FGB-3 and FGB-6 and simply observed a contact between the terrace and bedrock with no adverse orientations. Nonetheless, as discussed below, the entirety of the terrace (or ancient slide as described by Leighton) will be remedially removed and recompacted as a controlled and certified fill.*

Qlsa5- *This ancient slide is delineated by Leighton as a smaller slide to the west of Qlsa4. No evidence was found within Leighton's exploratory logs for the existence of this slide on the subject pad. The interpretation of this ancient slide is based entirely on borings located along Bayshore Drive to the south of the subject property. This firm drilled FGB-9 and found no evidence of ancient sliding or adverse orientations. Nonetheless, as discussed below, the entirety of the terrace (or ancient slide as described by Leighton) will be remedially removed and recompacted as a controlled and certified fill.*

Qlsa6- *This slide is located entirely offsite and to the west, and does not affect the subject property.*

In summary, evidence from Leighton and Associates (L&A) which positively identifies or locates head scarps, toes, slide planes, or other geomorphic features that are related to landsliding, appears to be very limited. Furthermore, L&A concluded that there are no known reactivations of the underlying ancient landslides.

According to L&A, the recent landsliding which occurred below the property line followed excessive rainfall in 1978 and occurred due to the failure of fill material that was placed on the lower pad, making up the lower terrace adjacent to Bayshore Drive, during early grading in 1952.

Smaller surficial failures were observed by Leighton and Associates on the south descending slope along the southern property line. Leighton and Associates attributed these shallow slumps to the uncontrolled or concentrated runoff over the top of the slopes due to diversions caused by CalTrans. The superficial failures were determined to have occurred in fill material overlying the subject site. None of the recent surficial slides have been observed to be deep seated.

In October of 1989, LeRoy Crandall and associates provided a geotechnical review of the subject site which did not include any additional on-site investigations. This report provided little to no value for the purpose of landslide assessment on the subject property.

In 1981 the County of Los Angeles established The Malibu Road Landslide Assessment District, following the activation of the recent landslide in 1978 on the properties below the subject on Bayshore Drive and Malibu Road. The Malibu Road district was monitored annually by the City until 1991, then independently monitored by consultants from 1991 to the present.

In an effort to quantify movement and the stability of the Malibu Road district, a series of hydraugers, slope inclometers, piezometers, and dewatering wells were installed beginning in the early 1980's. By 1998 Slope inclometers/piezometers SI-5 and SI-6 were installed along Bayshore drive, just south of the subject property. Since quarterly measurements began in 1998 (and continue today) of both SI-5 and SI-6, annul reports conclude that no significant movement is occurring.

C.Y. Geotech, Inc. (CYG) provided a geotechnical investigation in August of 2000, which included the drilling of 5 bucket-auger borings to a maximum depth of 66 feet, five test pits, and five seismic trenches to a maximum depth of 12.5 feet. Data collected by CYG contains no evidence of landslide planes or landslide debris within any of the excavations on the subject property.

3.5.2 LANDSLIDE CONCLUSION

Intensive review of research shows that, while there has been an abundance of exploration on the subject property, no one has been able to clearly identify and map the ancient landslide boundaries or related structural features that likely exist beneath the subject property.

The pre-graded site topography does suggest that ancient landslides exist, at least partially, beneath the subject property. However, the extent and depth to which the ancient slides exist remains uncertain as indicated by previous and current geologic explorations.

No evidence of ancient landsliding was observed within the recent excavations performed by this firm. The inferred landsliding on the subject site seems to be the contact between the overlying alluvium/terrace and the underlying bedrock. No evidence of landsliding within the bedrock was observed.

The recent landsliding that has occurred (e.g. 1978) and surficial slumping are not related to deep seated failures and were predominantly due to poor drainage conditions. Active landsliding along the slope below the subject property is entirely offsite.

In addition, we answered the following specific question from the City of Malibu Reviewers in our response letter dated November 20, 2018.

Item 5
The PGC (Project Geotechnical Consultant) states in the ***Landslide Conclusion*** *section of their report that no evidence of ancient landsliding was observed based on their exploration, and no evidence of landsliding within the bedrock was observed. They also state that, while there has been an abundance of exploration on the property in the past, no consultant has been able to clearly identify and map the landslide boundaries, and the extent and depth to which the landslides exist remains uncertain as indicated by previous and current exploration. However, the geotechnical map indicates most of the exploratory borings performed by the consultant to further assess landslides at the site are located very close to the limit of the landslides. Based on the above, the PGC needs to update their geotechnical map and cross-sections to depict their interpretation of the geologic conditions under the site based on all subsurface data presented to date. Additional exploration appears necessary to further characterize the conditions and map with certainty the limits and depths of landslides which may affect the proposed development on and adjacent to the property.*

Response:
An updated map is provided to illustrate the interpretations by this office of the existing subsurface conditions. Any material previously identified as part of an ancient landslide by others will be removed as part of the development of the property. Further investigation of a condition that will be remediated as part of the development does not appear to be warranted.

An additional map, separate from the "Geotechnical Map" is labeled as a "Geologic Map" and is included to illustrate all previous investigations in the site vicinity. This additional map is being used to reduce confusion on the Geotechnical Map and to illustrate the extent of work completed within and around the site.

To summarize, the ancient landslides that are illustrated on the maps are a conservative acceptance of previous interpretation. The site will be stabilized with a row of soldier piles at the top of the descending slope, and any potentially adverse geologic conditions will be completely removed through grading. Moreover, geogrid will be utilized to reinforce the newly removed and recompacted material to achieve an acceptable factor of safety.

As outlined in the landslide summary below, even though the site was previously interpreted to have ancient landslides, a detailed review of the individual boring logs within the delineated ancient landslides does not conclusively support those findings. Boring logs by this firm and others are also attached for reference.

Landslide Summary

A discussion of borings by others on site and within the inferred ancient landslides is included below.

Qlsa-2

Robert Stone and Associates (1968/69)

B-11: Boring eleven only provides structural measurements at depths of 40.5, 42.5 and 49 feet beneath the surface in the bedrock. The orientation observed at 40.5' is simply a contact between the marine terrace material and the bedrock. The contact is a shallow southeast dipping plane (9-12°) that is reasonable for such wave cut and near shore depositional environments.

Two clay beds were measured at 42.5 and 49 feet and they both dip approximately 30° towards the northeast and into the slope. Fracturing typical of normal geologic process were recorded, but no landslide was directly observed in this boring.

B-13: Boring thirteen contains structural measurements at 4, 21, 25, and 40 feet below the ground surface. All measurements, with the exception of one, dip generally in a north direction ranging from 11 to 60° at most. Similar to boring 11, a gently (~20°) southeast dipping contact is recorded between the terrace material and bedrock. Fracturing and minor shearing typical of normal geologic process were recorded, but no landslide was directly observed in this boring.

Additionally, this inferred ancient slide will be completely isolated by a row of north-south trending piles and no habitable structures will be built within the delineated "No Build Zone". This is a precautionary measure adopted to isolate the site from the historically unstable Puerco Canyon.

C.Y. Geotech (2000)

B-1: Boring one contains no structural measurements for reference. Fracturing and minor shearing typical of normal geologic process were recorded, but no landslide was directly observed in this boring.

Qlsa-3a

Stone Geological (1962)

B-4: Boring four contains one structural measurement striking N 68° E 37°S at a depth of 33-35' beneath the surface. This feature was interpreted as a "glide" plane, but the material was not designated as being landslide affected. Fracturing and minor shearing typical of normal geologic process were recorded, but no landslide was directly observed in this boring.

Robert Stone and Associates (1968/69)
B-10: Boring ten contains structural measurements at 10, 20, and 43' beneath the ground surface. A west dipping 25° contact is observed between the marine terrace material and underlying bedrock. At 20 feet the observed bedding orientation is dipping 25° towards the northeast, into the slope. A "possible slide plane" is observed at 32.5' however no orientation or description is given. The final bedding orientation at 43' is also observed to dip towards the northeast approximately 70°. Fracturing and minor shearing typical of normal geologic process were recorded, but no landslide was directly observed in this boring.

C.Y. Geotech (2000)
B-2: Boring two contains structural measurements at 17.3, 32.5, and 59 feet beneath the ground surface. A south dipping (33°) plane was measured at 17.3 feet and is interpreted as a thin clay layer. It is unclear if the measurement is in bedrock or terrace material, but descriptions more closely represent the onsite terrace material and we therefore interpret this plane as a basal contact between the terrace and bedrock. The depth of this contact is consistent with other interpretations and is a reasonable assumption based on the available data. At 32.5 feet a bedding orientation within the bedrock is measured to dip 73° towards the south. While this is a steep bedding orientation, it is consistent with overturned and folded bedding previously observed within this bedrock. At 59 feet a joint is measured to dip 83° towards the north. Fracturing and minor shearing typical of normal geologic process were recorded, but no landslide was directly observed in this boring.

Qlsa-5
Stone Geological (1962)
B-8: Boring eight contains no recorded structural measurements within the boring. A "slide plane" is recorded at 15 feet beneath the ground surface but not substantiated with a measurement or description of the material. This observation is therefore not considered useful for interpreting underlying conditions. Fracturing and minor shearing typical of normal geologic process were recorded, but no landslide was directly observed in this boring.

C.Y. Geotech (2000)
B-5: Boring five contains an abundance of structural measurements within the bedrock at 10, 13, 19.5, 23.5, 53.5, and 58.5 feet beneath the ground surface. At 13 feet bedding was observed to dip 40° to the north, into the slope. South dipping bedding orientations were measured to range from 19 to 54° for the remaining depths. While these orientations are locally out of slope, no landslide was directly observed within this boring. The observed fracturing and shearing is typical within this bedrock due to normal geologic processes.

Additionally, annual reporting by Fugro (2018) of the Malibu Road Landslide Assessment District indicates that no detectable movement has occurred in the slope inclinometers installed along Bayshore drive, south of the site. If ancient landslides do underlie the site, there is no evidence of recent movement since observations began in 1998.

In conclusion, despite an abundance of work, no consultant has been able to clearly identify and map the ancient landslide boundaries, and the extent and depth to which these landslides exist remains uncertain. Our interpretation is therefore a conservative acceptance of previous work to err on the side of safety for this project and neighboring properties.

ALLEGATION 2
The Feffer report only uses circular failure modes in analysis. The failure modes should be a user specified input. Furthermore, Shear strength utilized are not appropriate for the analysis.

RESPONSE
The statement is factually incorrect, and it appears Ralph just ignored or did not review the submitted reports. This firm performed both circular and translational (also known as planar) slope stability analysis to evaluate both types of failures for static and seismic conditions.

Furthermore, our extensive analysis evaluated the entire site slope, offsite portions of the slope, and even considered the possibility of the offsite slope failing away at the request of the City's reviewing engineer.

The complex analyses modeled landslide material, weak bedrock, high groundwater levels, and any potentially geologically hazardous conditions to provide the most conservative, and therefore safest approach for development.

The resulting soldier pile and tieback design that was approved was designed such that the entire site will remain safe and standing, even if the offsite portions (not owned by our client) has any instability issues.

As stated in the November 18, 2021 report as a response to a specific review item presented by the City of Malibu the following was provided:

Item 4
The consultant needs to perform translational slope stability analyses on all cross-sections with potential adverse geologic conditions (examples: Cross-Sections 2-2', 3-3', 4-4', 5-5' and 6-6'). Substantiated residual shear strength (example: residual shear strength used for landslide planes) should be utilized to model along-bedding shear strength. Mitigation measures should be recommended, as necessary.

Response:
A letter titled "Preliminary Slope Stability Analysis, 25200-25300 Pacific Coast Highway, Malibu, CA 90265" dated March 25, 2021 was provided to the reviewers to open a discussion regarding the selection of appropriate shear values for use in the requested translational analyses. A copy of this letter is provided at the back of this response for the record.

A conference call was initiated between this firm and the reviewers to mutually review and agree on the selection of shear values. Based on that call and the presented letter, all parties agreed that the following values could be used for the translational analysis.

Material	***Phi Angle (°)***	***Cohesion (psf)***	***Type***
Bedrock	*34.5*	*520*	*Ultimate*
	41	*720*	*Peak*
	16	*200*	*Back calc.*

The ultimate value shall be used to model static conditions, and the peak value shall be used to model seismic conditions that apply a 0.35g horizontal acceleration. To model potential adverse bedding planes an anisotropic function shall be adopted for south dipping bedding planes ranging from 10 to 30 degrees and the selected residual value will be applied to this range of bedding planes for translational analysis. Groundwater was also modeled in the additional analyses where applicable.

Translational Stability Analysis

As requested, cross sections 2, 3, 4, 5 and 6 were analyzed for translational stability to model potential adverse geologic conditions. Each section was analyzed under the "post construction" condition to consider all proposed new grades, building loads, groundwater conditions, and reinforcements. Each analysis utilized the spencer method with a non-circular block search. Search windows were placed at the top and bottom of each slope based on a trial-and-error method of selection. Once search windows were defined, reinforcements were added to the slopes and modified until reaching a 1.5 and 1.0 factor of safety (FS) for static and seismic conditions.

The analyses indicate that the existing slopes require a stabilization system to achieve a 1.5 and 1.0 factor of safety and to mitigate potential geologic instability.

It should be noted that section 6-6' was not evaluated further because most of the slope for section 6-6' is within the delineated "No-Build Zone". As stated in previous responses, the proposed row of piles is only recommended to isolate the proposed development from the "No-Build Zone" and are not required to increase the global factor of safety for the slope. As illustrated on the updated translational analysis, all factors of safety less than 1.5 exist within the "No-Build Zone", do not intersect the proposed row of piles, and do not intersect the proposed development. The existing slope in this area is performing well under current conditions but should not be modified.

Pile Design Analysis

After performing the translational analyses, a separate set of analyses were performed for sections 2, 3, 4, and 5 to evaluate the pile loads needed to achieve a 1.5 and 1.0 FS for each portion of the slope. A discussion is provided below:

Offsite Slope

First, we evaluated the offsite portion of the slope from the southern property line to Bayshore Drive. The purpose of this analysis was to determine if the offsite portion of the slope had adequate factors of safety. A summary of the results is provided below:

Section	***Static/Seismic***	***Factor of Safety***
2-2'	*Static*	*0.874*
	Seismic	*0.460*
3-3'	*Static*	*0.952*
	Seismic	*0.528*
4-4'	*Static*	*1.007*
	Seismic	*0.562*
5-5'	*Static*	*1.141*
	Seismic	*0.670*

Offsite Slope Removal

Once we determined the existing FS for the offsite portion of the descending slope, the "failed" wedge of material was removed from each section until the FS was no longer less than 1.5 or 1.0 for static and seismic conditions.

The removal of this material left a freestanding portion of the piles at the property line. The purpose of this analysis was to evaluate the project site under the theoretical assumption that the descending slope failed away and left behind the slope stabilization system.

Due to the complexity of the site geology, the following analyses were used to determine the pile loads required to retain the project site in a post failure condition.

Upper Slope

Next, we evaluated the pile loads required to stabilize the site between the top of the slope and the bottom of the freestanding pile (determined from the analysis above) under static and seismic conditions. This required an iterative approach in which piles were added and loads were increased until achieving a 1.5 and 1.0 FS.

Entire Slope

Finally, to evaluate deep seated instability we evaluated the pile loads required to stabilize the site between the top of the slope and the bottom of the slope. This also required an iterative approach in which piles were added and loads were increased until achieving a 1.5 and 1.0 FS. A summary of the analyses and recommendations for the design of the stabilization system is provided on Table 1. The project engineer should use these values to design an appropriate stabilization system. A combination of grade beams, tiebacks, or other methods may be used to assist in the design to accommodate high pile loads.

Conclusion
The attached analyses indicate that the existing slopes require a stabilization system to achieve a 1.5 and 1.0 factor of safety and to mitigate potential geologic instability. Once reinforced, the slopes are considered grossly stable. The updated site map and cross sections illustrate the proposed locations of the support system.

The updated geotechnical map is color coded to illustrate the approximate proposed pile locations. Transitions between piles with different depths shall occur approximately at the midpoint between analyzed sections. The actual number of piles, their precise locations, and actual dimensions will be determined by the project Structural engineer given the information provided herein. Prior to submittal, the slope stabilization design and layout should be provided to this firm for review and approval.

The analysis we used, the shear strengths adopted, and the depiction of the underlying geology was developed over 5 years with extensive review and subsurface investigation and laboratory testing and is appropriate for the site.

Our offices analysis was conducted utilizing both a geologist and civil engineer and in the opinion of the City reviewer, Ali Abdel-Haq, was well founded on appropriate data and methodology.

Pacific Coast Land Consulting has provided no analysis or alternative methodologies to support their allegation.

ALLEGATION 3
The pile system is too shallow to accommodate an upper slide surface and a lower slide surface. The existing factor of safety is based on rotational conditions only and does not include any analysis of a complex slide surface.

RESPONSE
Not only is this statement false, but is not based on any independent analysis. Ralph has not provided any evidence to support the claims made.

Our conclusions are based on the most conservative interpretation of the underlying geology that is supported by extensive subsurface exploration, laboratory data, and stability analysis completed by this firm. This issue was extensively reviewed and approved over 5 years and multiple reports on an iterative process with Chris Dean and Ali Abdel-Hak, reviewers for the City of Malibu.

The descending slope is about 70 feet in height. The preliminary structural design consists of two rows of piles near southern property line and one row of piles along the western portion of the site. These piles extend nearly the entire length of the site and will extend to depths ranging from 48 to 78.4 feet below the ground surface.

In addition, two rows of tiebacks ranging in length from 101 to 129 feet will also penetrate the slope and provide additional support for the soldier piles.

This complex design is based on the geotechnical recommendations that were provided by this firm in our report dated November 18, 2021. A preliminary pile design schematic is attached to the back of this letter.

ALLEGATION 4

There is inclinometer monitoring data that indicates the active slide is much larger and deeper that has been previously analyzed. Slope indicator reports show movement in si-5 and si-6 at depths of elevations of 32' and 39'. This much deeper that the currently mapped active slide and indicates that the head scarp of the upper slide will, be located up slope on the subject proper(sic)

RESPONSE

This allegation is contradicted by the City of Malibu Assessment District Report dated March 20, 2025 *"FY23/24 Maintenance and Monitoring AD98-3, Malibu Road, City of Malibu by Yeh Project No.220-278."*

The following is taken directly from section 2.2.1 Summary of Slope Inclinometer Monitoring Events, Page 5 of the referenced report.

A summary of key observations over the Monitoring Year include:

- The onset of new shear-type movement on the order of 0.2 inches or less was detected in inclinometers SI-1A, -2A and -4A during the Q1 surveys. No movement was recorded in SI-5 and SI-6.

The report specifically states that no movement was recorded in SI-5 and SI-6.

Additionally on Page 6 of the report, table 5 summarizes all of the inclinometer data.

FY23/24 Maintenance and Monitoring Report
AD98-3 Malibu Road

Project No. 220-278
March 20, 2025

Table 5: Summary of Inclinometer Survey Results

Facility ID	Interpreted Shear Displacement (inches)									
	6/9/23 to 1/11/24	1/11/24 to 2/7/24	2/7/24 to 2/13/24	2/13/24 to 2/21/24	2/21/24 to 2/28/24	2/28/24 to 3/7/24	3/7/24 to 3/13/24	3/13/24 or 3/7/24 to 9/16/24	Cumulative For 23-24 Monitoring Year	Depth of Interpreted Shear (feet)
SI-1A	none	none	<0.01	<0.01	<0.01	none	none	none	0.02	28
SI-2A	none	<0.01 (possible)	0.03	0.09	0.04	<0.01 (possible)	Access Blocked	none	0.16	32-34
SI-4A	none	none	0.03	0.12	0.05	<0.01 (possible)	Access Blocked	none	0.20	30-34
SI-5	None	none	N/R	N/R	none	none	N/R	N/R	none	N/A
SI-6	None	none	N/R	N/R	none	none	N/R	N/R	none	N/A

As can be seen, no movement was recorded in SI-5 and SI-6.

CONCLUSION

Over a more than 5-year period, this firm has spent countless hours performing onsite exploration (including physical downhole logging and trenching), a suite of laboratory testing, thorough and extensive review of previous work, and complex engineering calculations. The time spent has allowed us to not only become intimately familiar with this site, but to provide conservative geotechnical recommendations that will allow for a safe and habitable development. The construction of the recommended soldier pile and tieback design will ultimately result in a slope condition that is safer than its present condition.

Mr. Jeffery makes numerous allegations in a short 5-page report against our professional judgment, reporting and analysis, none of which is based on any independent engineering analysis/calculations, thorough review of reports (both our reports and decades worth of previous reporting by previous consultants, which are all publicly available), or any presentation of supporting data.

COMMUNITY DEVELOPMENT DEPARTMENT

NOTICE OF PUBLIC HEARING

NOTICE OF PUBLIC HEARING

The Malibu Planning Commission will hold a public hearing on **Tuesday, December 16, 2025, at 6:30 p.m**. in the Council Chambers, Malibu City Hall, 23825 Stuart Ranch Road, Malibu, CA for the project identified below. Public comment can be submitted ahead of the public hearing to planningcommission@malibucity.org for inclusion in the public record. To participate during the public hearing, please review the meeting agenda posted at MalibuCity.org/AgendaCenter and follow the directions for public participation.

COASTAL DEVELOPMENT PERMIT NO. 19-012, CERTIFICATE OF COMPLIANCE NO. 21-004, AND LOT MERGER NO. 24-002 - An application for the construction of a new one-story, 9,219 square- foot single-family residence, including a 1,000 square-foot subterranean two-car garage, 1,523 square-foot basement, 676 square- foot gym, detached 465 square- foot detached guest house, swimming pools, driveways, decks, landscaping, water features, hardscape, grading, retaining walls, and onsite wastewater treatment system; including a certificate of compliance to recognize an illegally created lot consisting of two parcels, and a lot merger to consolidate two parcels into one

LOCATION / APNs:	**25200 Pacific Coast Hwy** / 4459-013-021 and 4459-014-018
ZONING:	Rural Residential-Two Acre (RR-2)
APPLICANT / OWNER:	180 PCH, LLC / PAR PCH LLC
APPEALABLE TO:	City Council and California Coastal Commission
ENVIRONMENTAL REVIEW:	Categorical Exemption CEQA Guidelines Sections 15303(e) and 15303(a)
APPLICATION FILED:	March 7, 2019
CASE PLANNER:	Allison Cook, Contract Planner, capstonecityplan@gmail.com (805) 415-1991

A written staff report will be available at or before the hearing for the projects. All persons wishing to address the Commission regarding these matters will be afforded an opportunity in accordance with the Commission's procedures. Copies of all related documents can be reviewed by any interested person at City Hall during regular business hours. Oral and written comments may be presented to the Planning Commission on, or before, the date of the meeting.

LOCAL APPEAL - A decision of the Planning Commission may be appealed to the City Council by an aggrieved person by written statement setting forth the grounds for appeal. An appeal shall be filed with the City Clerk within ten days following the date of action which the appeal is made and shall be accompanied by an appeal form and filing fee, as specified by the City Council. Appeal forms may be found online at www.malibucity.org/planningforms or in person at City Hall, or by calling (310) 456-2489, extension 246.

COASTAL COMMISSION APPEAL - An aggrieved person may appeal the Planning Commission's approval directly to the Coastal Commission within 10 working days of the issuance of the City's Notice of Final Action. More information may be found online at www.coastal.ca.gov or by calling 805-585-1800.

IF YOU CHALLENGE THE CITY'S ACTION IN COURT, YOU MAY BE LIMITED TO RAISING ONLY THOSE ISSUES YOU OR SOMEONE ELSE RAISED AT THE PUBLIC HEARING DESCRIBED IN THIS NOTICE, OR IN WRITTEN CORRESPONDENCE DELIVERED TO THE CITY, AT OR PRIOR TO THE PUBLIC HEARING.

YOLANDA BUNDY, Community Development Director Date: November 20, 2025

Re: Coastal Development Permit (CDP) #19-012, Conditional Certificate of Compliance #21-004 and lot merger #24-002

Dear Planning Commissioners,
We live at [redacted] Malibu Road and our home is directly beneath the subject property on a bluff overlooking Malibu Road. On "our" bluff, we are very conscious of our neighbors and their properties. Our concerns are that we are protected from any potential landslide, that drainage from either rain, landscape watering, or runoff from PCH; and that their septic system doesn't compromise our property in any way.
From what I've seen, the project looks well thought out and will be a good addition to our community.
Please issue their requested permits so that they can complete the building of their beautiful new home and improve our neighborhood's aesthetics. Mr. Weintraub has proven himself to be a good and caring neighbor for several years by maintaining his vacant property and biannually cutting back the overgrowth of weeds to meet the requirements of the fire department.

Sincerely,

Chris & Pat Reed

2021.11.18 Final Geotechnical Report re PARPC...

Re: 25200 Pacific Coast Highway – Request for Nullification of Approvals Due to Non-Compliance with LCP, LIP §9.4(D), CEQA, and Building Code Requirements

Attention:
Alison Cook – Contract Planner
Trevor Rusin - Interim City Attorney
Yolanda Bundy – Building Official/Community Development Director
Tyler Eaton – Assistant Community Development Director
Rob DuBoux – Head of Public Works

Dear Staff,

Malibu Township Council writes to formally request that the City **nullify all approvals** associated with the proposed development at **25200 Pacific Coast Highway**, as the administrative record clearly demonstrates that the project **violates the Malibu LCP**, **fails to comply with LIP §9.4(D)**, **requires—but has not requested—a variance**, and **is not eligible for CEQA exemptions**.

We attach for reference the **April 26, 2021** letter from **Elkins Kalt**, which resulted in the indefinite continuance of a **770 sq ft addition** at **20238 Piedra Chica Road**—also in the Big Rock Landslide Assessment District. That project was halted because it:

1. did not conform to the LCP,
2. required a variance,
3. did not comply with applicable building code sections, and
4. was not exempt from CEQA.

The same facts—and in this case, far more severe ones—are present at 25200 PCH, where the proposal is not a minor addition but an entirely new **12,000-square-foot** development with a basement, underground garage, multiple pools, extensive grading, and substantial new loading on an active landslide.

---

1. The Project Cannot Lawfully Proceed Because It Does Not Meet the Required Factor of Safety Under LIP §9.4(D)

Date Received 12/12/25 Time 1:45 p.m.
Planning Commission meeting of 12/16/25
Agenda Item No. 5C
Total No. of Pages 711

CC: Planning Commission, PD,

Recording Secretary, File

LIP §9.4(D) mandates:

> "New development proposed on landslides… shall be permitted **only <u>where</u> a factor of safety of 1.5 (static) and 1.1 (pseudostatic) can be provided**."
>
> "Analyses shall demonstrate a factor of safety ≥ 1.5 for static and ≥ 1.1 for seismic… **modeling <u>worst-case</u> geologic and slope gradient conditions**."

Critically, these analyses must evaluate **the natural, pre-construction slope condition—before** piles, grading, or stabilization.

The applicant's own geotechnical consultant explicitly admits that the site cannot meet the required factor of safety without major engineered stabilization.

In the March 25, 2021 translational stability analyses incorporated into the November 18, 2021 Feffer Report attached, the consultant concludes:

> **"Preliminary static analyses of translational stability [were] achieving factors of safety slightly greater than 1.0…"**
> (Feffer, 3/25/21, incorporated in 2021.11.18 report p 563)

These reported FS values (**1.094 – 1.186**) are **far below the required 1.5 threshold.**

Feffer then makes an unequivocal admission in the November 18, 2021 report on p 6:

> **"The analyses indicate that the existing slopes require a stabilization system to achieve a 1.5 and 1.0 factor of safety and to mitigate potential geologic instability."**

This statement is dispositive:

• The natural slope does not meet LIP §9.4(D).

• A stabilization system is required just to approach minimum safety.

• Therefore, a variance is legally required under LIP §13.26.

There is **no discretion** to avoid the variance. The LIP does not allow "mitigated compliance"—it requires **natural-condition compliance**.

Because the project fails this mandatory test, all project approvals must be nullified.

---

2. A Variance Is Required Under LIP §13.26 – and None Has Been Requested

LIP §13.26 states:

> "A variance shall not be granted which confers a special privilege… A variance is required for any deviation from the standards or requirements of the Malibu LIP."

This project deviates from the most fundamental geologic safety standard in the LCP.

The applicant:

- Cannot meet FS 1.5 (static) or 1.1 (seismic) in the actual landslide condition;
- Admits stabilization is required *before* compliance;
- Provides no natural-condition cross-sections achieving required safety levels;
- Attempts to substitute "post-construction" modeling for required baseline analyses.

Therefore:

A variance is legally required before any further review.

And critically:

This application cannot lawfully proceed to the Planning Commission because, under the LCP and LIP §13.26, and the City's own geotechnical standards, a variance must be obtained before any further processing, and no such variance has been applied for or evaluated. The City has no authority to advance the project to public hearing without first satisfying this mandatory prerequisite.

---

3. The Project Is Not the Least Environmentally Damaging Alternative Required by LIP §9.4(E)

LIP §9.4(E) requires:

> "Measures to remediate or stabilize landslides… shall be designed to be the **least environmentally damaging alternative** and to minimize landform alteration."

This project represents the **opposite**:

- Over **12,000 sq ft** of development
- A full basement and underground garage
- **12 bedrooms and bathrooms**
- Multiple pools and water features
- A septic system exceeding **7,500 gallons**, dispersing **over 1,000 gallons/day** into unstable soil

Former City Geologist **Donald B. Kowalewsky** warned in 2018 (20272 Inland Lane) included in the Elkins Kalt letter attached:

> **"The introduction of additional mass and water into the ground in Big Rock Mesa will result in a lower safety factor."**

Yet this project dramatically **increases** both mass and water, directly contrary to expert guidance and LIP §9.4(E).

The Feffer report further acknowledges the extensive mitigation required simply to make the

slope marginally stable:

> "**The existing slopes require a stabilization system to achieve a 1.5 and 1.0 factor of safety…**"

A development that **requires** massive stabilization on an **active landslide** cannot be considered the least environmentally damaging option.

---

4. Deep Pile Embedment (~100 ft) Into a Known Landslide Is Geologically Dangerous and Unsupported

The only numerical pile lengths disclosed anywhere in the Feffer report appear in the **Slide model output**, showing piles approximately **99–112 feet deep**.

Such extreme embedment:

- Penetrates directly into the landslide mass;
- Risks disturbing or reactivating shear zones;
- Alters stress conditions in very weak materials (residual $\varphi = 16°$, $c = 200$ psf);
- Creates new stress concentrations and potential slip surfaces;
- Redirects groundwater in ways that may further destabilize the slope.

Yet the report provides **no geologic justification** demonstrating these ~100-foot piles will not worsen slope instability. Despite this, the applicant relies on these same unverified piles to claim compliance with LIP §9.4(D)—which is impermissible.

This further reinforces the necessity of a **variance** and independent geotechnical review.

---

5. CEQA Exemptions Do Not Apply Due to Unusual Circumstances and the Probability of Significant Environmental Impacts

An active landslide, extensive subsurface disturbance, increased water load, and a known broken pipe beneath the property constitute **unusual circumstances** under CEQA Guidelines §15300.2(c).

There is a clear "**reasonable possibility of a significant effect**" due to:

- Instability of the landslide mass;
- Added mass and water;
- Deep pile installation;
- Existing saturation from broken infrastructure.

Therefore, **categorical exemptions cannot apply.**

Conclusion

Because:

- The **natural slope fails** to meet LIP §9.4(D),
- The applicant's geotechnical consultant **admits stabilization is required** to reach minimum FOS,
- The project **requires—but has not applied for—a variance**,
- The proposal is **not** the least environmentally damaging alternative,
- Deep piles pose significant risk to the landslide mass, and
- CEQA exemptions **cannot lawfully be used**,

all project approvals must be nullified.

Furthermore, this application cannot lawfully move forward to the Planning Commission because, under the LCP, LIP §13.26, and the City's own geotechnical standards, a variance must be obtained before any further processing. No such variance has been submitted or evaluated. The City therefore has no authority to advance the project to public hearing until this mandatory prerequisite is satisfied.

This is precisely the kind of egregious, non-compliant project that has contributed to Malibu's backlog and undermined public confidence during the city's rebuild recovery —just as occurred with the Malibu Inn Hotel, whose geotechnically unsound 55-foot retaining wall triggered extensive delays, appeals, and ultimately rejection by the City Council. That outcome could and should have been avoided entirely had Planning identified the non-compliance early, instead of forcing residents, the City Council, and City staff to expend hundreds of hours producing and reviewing voluminous, non-compliant staff reports that should never have been necessary at all, and were the direct result of avoidable failures in the early compliance review—failures that burdened staff, misled decision-makers, and forced residents to correct issues that should have been caught immediately.

Malibu Township Council urges the City to uphold the LCP, protect public safety, and halt all further action on this application unless and until it demonstrates full compliance with all applicable laws.

Sincerely,

Jo Drummond

Malibu Township Council

Subject: 25200 PCH - Weintraub property
To: John Mazza [redacted], <skylar@peak[redacted]>, <drew[redacted], Elizabeth Riddick [redacted], marni kamins [redacted]>, Yolanda Bundy <ybundy@malibucity.org>, Tyler Eaton <teaton@malibucity.org>, Trevor Rusin <trevor.rusin@bbklaw.com>, <kellan.martz@bbklaw.com>
Cc: Bruce Silverstein <bsilverstein@malibucity.org>, Bill Sampson [redacted], Sam Hall Kaplan <[redacted]>, Dru Jacobson [redacted]>, Patt Healy [redacted]>, R N <ryan[redacted]>, Rob Duboux <rduboux@malibucity.org>, Ann Doneen <[redacted]>, Mariela Guastavino <[redacted]>, Jyoti Drummond [redacted]>, <cbond@malibucity.org>, <rrojas@malibucity.org>

Attention: Planning Commission, Yolanda Bundy, Tyler Eaton, and Trevor Rusin

The Malibu Township Council (MTC) previously submitted letters on July 21 and August 10 (both attached) regarding the Weintraub project. To date, those concerns have not been addressed. The most critical omission remains the failure to comply with **LIP §9.4D** (attached), which requires all new development in landslide areas to demonstrate a factor of safety of 1.5 (static) and 1.1 (pseudostatic). If those thresholds cannot be met, a variance must be obtained.

This project is a **brand-new, over 12,000 sq. ft. construction** in the Malibu Road Landslide Assessment District. Unlike routine fire rebuilds, this is a discretionary proposal on an undeveloped lot. In a past case at **20238 Piedra Chica Rd**, even a 25% addition had to be sent back after Planning Commission and City Council review when it was discovered no variance had been filed under §9.4D. That error wasted nearly three years of city resources. Approving this project without the variance requirement addressed risks repeating the same mistake.

Compounding the problem, there is a **broken and leaking Caltrans storm drain pipe under this property** that has caused multiple landslides in the past. The City's Public Works Director, Rob Duboux, has confirmed this on record. The applicant does not have the authority to repair this pipe, and the matter must be resolved by Caltrans **before any approvals can be considered**.

Beyond geotechnical hazards, the project would also cause **substantial obstruction of public scenic views**, contrary to the LCP.

MTC recognizes that Planning staff are managing hundreds of Woolsey and Palisades Fire rebuilds—work that should be the City's top priority. **Oversights like the missing variance requirement reflect how stretched staff have become, and why their focus must remain on rebuilding Malibu rather than processing code-violating projects like this one.**

For efficiency, and to prevent further waste of time and resources, **MTC requests that this item be removed from the agenda until**:

1. The applicant files for the required variance under **LIP §13.26.5**,

2. All slope stability studies required by **LIP §9.4D** are completed,

3. The broken Caltrans storm drain pipe is repaired by the responsible agency, and

4. Public view obstruction impacts are fully mitigated.

Under **LIP §13.26.5**, a variance can only be approved if all of the following findings are made, supported by substantial evidence:

- **A.** Special circumstances exist such that strict application of the code would deprive the property of privileges enjoyed by others in the vicinity.

- **B.** The variance will not be detrimental to the public interest, safety, health or welfare, and will not be detrimental or injurious to the property or improvements in the same vicinity and zone(s) in which the property is located.

- **C.** The variance will not confer a special privilege.

- **D.** The variance will not conflict with the purposes and intent of the LCP.

- **E.** For variances to ESHA standards: no feasible alternative exists, and allowable development area is not exceeded.

- **F.** For variances to stringline standards: maximum feasible protection to public access is provided.

- **G.** The request is consistent with the purpose and intent of the zoning designation.

- **H.** The subject site is physically suitable for the variance.

- **I.** The variance complies with all requirements of state and local law.

- **J.** The variance does not reduce or eliminate public parking for beach, trail, or park access.

Given the project's size, location in a landslide district, unresolved infrastructure issues, and public view impacts, **most of these findings will be extremely difficult to satisfy.**

Thank you,

Jo Drummond
Malibu Township Council

On Aug 10, 2025, at 12:19 PM, Malibu Township Council <info@malibutownshipcouncil.org> wrote:

Urgent: Weintraub Application Missing Required LIP 9.4D Variance

Dear Yolanda,

The most critical omission in the Weintraub application is the required compliance with LIP 9.4D. Under this section, any new development in a landslide, steep slope, unstable soil, or other geologic hazard area must demonstrate, through slope stability analysis, a factor of safety of at least 1.5 (static) and 1.1 (pseudostatic). If this cannot be met, the applicant must obtain a variance and satisfy the ten findings in LIP 13.26.5 before moving forward. The Project is "new development" as defined by the LCP. It consists of land-disturbing activities including but not limited to, construction of a building or structure that will increase the floor area by more than ten percent. LCP, LIP §2.1.

We've been here before: in the Big Rock case at 20238 Piedra Chica Rd (CDP 18-002), the city had to send the project back to Planning for a variance application—after it had already gone through the Planning Commission and City Council (April 26, 2021) review —because no variance had been filed for the factor of safety. That error wasted nearly three years of staff, commission, and council time. The Weintraub property lies within the Malibu Road Landslide Assessment District, as noted in the latest staff report, yet none of the required 9.4D studies have been completed. Without those studies, the application cannot demonstrate the required factor of safety and is not eligible to proceed without a variance.

Such an attempt to sidestep the LCP is improper, and City Planning must deny the Project for its failure to conform with the LCP. As the LIP takes precedence over the City-adopted County and State Building Code, the City cannot discard development standards and variance requirements under the LCP. Especially where there are no noted impediments to complying with both the LCP and building codes. The Project applicant must file and process a variance to comply with the LCP.

For efficiency and to avoid repeating past mistakes, I request this item be removed from the agenda until the applicant applies for the variance and submits the required slope stability studies. Proceeding without these steps would not only repeat the Piedra Chica error but could also expose the city to significant legal and procedural risk.

Finally, LCP, LIP Section 9.4.M prohibits new development "on property or in areas where such development would present an extraordinary risk to life and property due to an existing or demonstrated potential public health and safety hazard."

I understand that many of these errors are due to the Palisades Fire and the need to rush applications already in planning but this needs to STOP and they all need to be put at the end of the line when there is more time to focus on HUGE code reaching projects. The focus NOW needs to be on the recovery of our community and rebuilding homes up to 10%.

Thank you,

Jo Drummond

Re: Appeal (AP) No. 19-010; 20238 Piedra Chica Road
Appealing Planning Commission Resolution No. 19-25, approving Coastal Development Permit No. 18-002 to allow for an interior and exterior remodel and 770 square foot addition to an existing 3,453 square foot single-family residence, including construction of a courtyard, balcony, exterior stairs, ground-mounted mechanical equipment, fencing, permeable pavers, grading, relocation of the dispersal field for an existing onsite wastewater treatment system, and replacement of existing landscaping

Dear Mayor and City Council Members:

We represent Colin and Joanne Drummond ("**Appellants**") in connection with the above-referenced appeal. Appellants request a continuance of the hearing of the appeal until a date following the completion and receipt of the City-commissioned reports by Yeh and Associates, Inc. ("**Y&A**") concerning the Big Rock Mesa Landslide Assessment District.

Support for Continuance

The hearing for Appeal No. 19-010 (the "**Appeal**") is currently scheduled to occur on September 28, 2020. However, City of Malibu (the "**City**") consultants are presently collecting data concerning Big Rock Mesa that remains critical to the issues raised in the Appeal, including but not limited to evaluating the need to refine and modify landslide geometries and models. All parties benefit by obtaining and evaluating the information developed by Y&A before the City Council considers the Appeal so that all may adequately evaluate the proposed project. We understand from Rob DuBoux, City Public Works Director, that the City anticipates receiving the information in September/October. As such, this request would not unreasonably delay the hearing.

T: 310.746.4400 F: 310.746.4499
10345 W. Olympic Blvd, Los Angeles, CA 90064 | elkinskalt.com

Background

On December 2, 2019, the City of Malibu Planning Commission adopted Resolution No. 20-18, approving Coastal Development Permit No. 18-002 for property located at 20238 Piedra Chica Road (the **"Property**") (approval referred to as "**Planning Commission Approval**"). The Planning Commission Approval found the project categorically exempt from the California Environmental Quality Act and allows for the interior and exterior remodel and 770 square foot addition to an existing 3,453 square foot single-family residence, including the construction of a courtyard, balcony, exterior stairs, ground-mounted mechanical equipment, fencing, permeable pavers, grading, relocation of the dispersal field for an existing onsite wastewater treatment system, and replacement of existing landscaping.

On December 12, 2019, Appellants appealed the Planning Commission Approval based on, among other things, a lack of adequate stability analysis. Importantly, Appellants noted that development near or on Piedra Chica Road, part of Big Rock Mesa, should not occur until the completion of a proper analysis of the ancient landslide and current slope stability. Prior to the Planning Commission Approval, no adequate landslide analysis existed for the Property, and the applicant's consultant clearly used outdated information to support the project.

On June 22, 2020, the City Council authorized the City Manager to execute a Professional Services Agreement with Y&A for, among other tasks, maintenance and monitoring services for the Big Rock Mesa Landslide Assessment District. As part of the agreement, Y&A will collect, compile and revise data, evaluate trends, and evaluate the need to refine and modify landslide geometries and models based on data from recent geotechnical investigations, as well as prepare reports summarizing monitoring and maintenance data. We understand from Mr. DuBoux that the consultant is currently collecting and evaluating data, and the City expects to receive the information in September/October of this year. Given the relevance of the findings to development in the Big Rock Mesa Landslide Assessment District, including that sought by CDP No. 18-002, receipt and evaluation of the consultant's information is crucial to the Appeal.

As noted by the Appellants in prior hearings and in the Appeal, the proposed addition will be the most substantial, both in size and increase of water fixtures, approved in Big Rock Mesa since the most recent landslide. Understanding the geology of the area and the slope stability of the Property remains critically important when considering additional development and the impact of such development on the stability of the existing landslide.

Conclusion

The Appeal raises multiple issues regarding the adequacy of the applicant's geological data in connection with the Planning Commission Approval, including objections to the use of outdated information. Obtaining the Y&A updated information for Big Rock Mesa is vital to determining future development in the area, including the development proposed on the Property. The practical and efficient review of the Appeal mandates the scheduling of the hearing **after** the City receives Y&A's data and findings.

We appreciate your consideration of the above request. Please contact our office with questions or comments.

Very truly yours,

Civic Guardian Since 1947

July 21, 2025

Honorable Planning Commission,

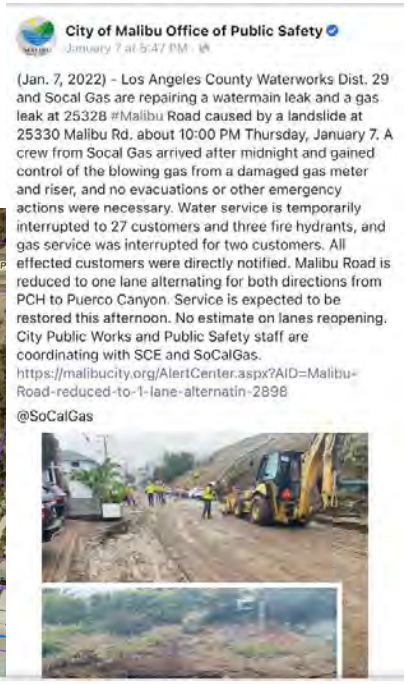
RE: 25200 Pacific Coast Highway, Coastal Development Permit No. 19-012

Malibu Township Council has been advocating for responsible development and protecting our natural, rural environment in Malibu since 1947.

These are reasons that the Planning Commission's decision on this project should be postponed.

1. The applicant should be required to redesign this project so that all structures are invisible from PCH.
2. Before you approve this project the applicant should come back with a revised landscape plan showing none of the vegetation will be at maturity above the height of the highway.
3. The berm along this property seems to have risen higher over the last few years and vegetation has been allowed to grow further blocking the beautiful scenic view from the PCH. This should be double checked for any illegal grading as requested by Mayor Pro Tem Silverstein at the last City Council meeting.
4. Landslide studies must be completed in the geotechnical review for this project prior to approval since several landslides have occurred adjacent to this lot AND it is entirely in the Malibu Road Landslide Assessment District and as new development needs to be deemed safe or not to build as NOTHING has ever stood on the lot. NOTHING in the staff report or review mentioned this at all. How can a project of this size and width be allowed in a landslide area when a similar project - Rappaport - caused landslides in a non-landslide area further on Malibu Road? There are several unbuildable lots just below this project on Malibu Road due to landslides. See p. 9 & 10 of this Assessment District report - under 5. Emergency Services: https://www.malibucity.org/DocumentCenter/View/31025/FY21-22-Annual-Report---Malibu-Road-AD-98-3?bidId= It states that the slope has been steepened by erosion and may be subject to further erosion and thus should be treated as a Coastal Bluff as there are only beachfront homes and some empty lots by the beachside in front of this bluff.
5. A broken 20-inch drainpipe that goes right through the middle of this lot has not been dealt with by the City, County or Caltrans or any private parcel owners and continues overflow, flood and erosion of the slope and the immediate areas causing several adjacent slides over the past decade. At the very least it should be mandated that the applicant repair this if he intends to proceed with the project. This would require finding out who is responsible for the pipe and receiving the appropriate permissions.
6. Clarity is needed on how large the septic tank is. The staff report on p 7 states that it will be 1500 gallons for a 7+ bedroom, 11+ bathroom complex with 5 pools, etc. as per the plans. Yet there is an OWTS plan buried within p 173 stating a 7540-gallon tank for a 6-bedroom, 12-bathroom residence incl guest house? If it is a 7540-gallon tank it should be reduced in size. Between this much effluent and excessive irrigation for over 70 trees, etc. planned this can put the landslide area in jeopardy from this one home which already has an eroding unstable slope. Excess water causes erosion and further landslide risk so safety findings cannot be made.
7. Why are more than four 6 ft back-to-back retaining walls proposed without a variance?
8. Here neighborhood standards for Malibu Road and Bayshore Drive needs to be accounted for - this project is more than 5 times the average size of the homes there and completely out of character of the remaining homes in the same assessment district, and NONE block the scenic ocean view as this one proposes. Cher's house nearby is NOT in the assessment district and was built before Cityhood so cannot be compared and this finding can't be made for residential development standards.
9. We were wondering why this project is a priority and not given more scrutiny over L4L fire rebuilds. Especially when it is obviously for a spec house as it is already being advertised for sale - https://www.weintraubre.com/projects/coleava/

Please either postpone a decision or deny this project until further information and studies are completed to ensure the public's scenic views are protected and that public safety is assured.



Thank you,

Jo Drummond
On behalf of Malibu Township Council

Established to promote, stimulate and further community spirit, to sponsor any project of merit that may benefit any district of Malibu Township, to foster and promote the cultural development of the Township; and in general, to do all things that tend to build and uphold the character of this residential area.

— Malibu Township Council Articles of Incorporation, January 2, 1947

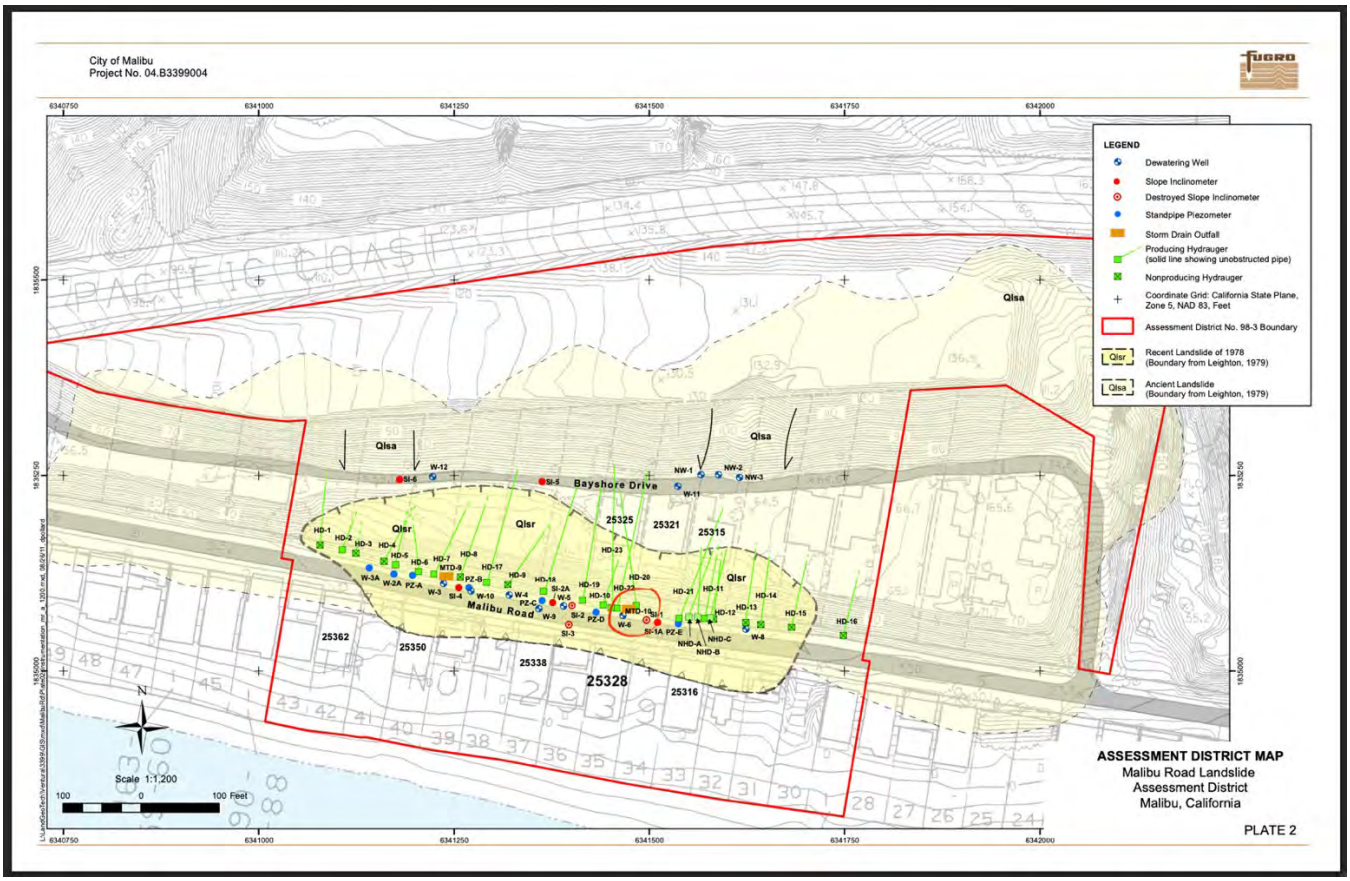
5. Emergency Services

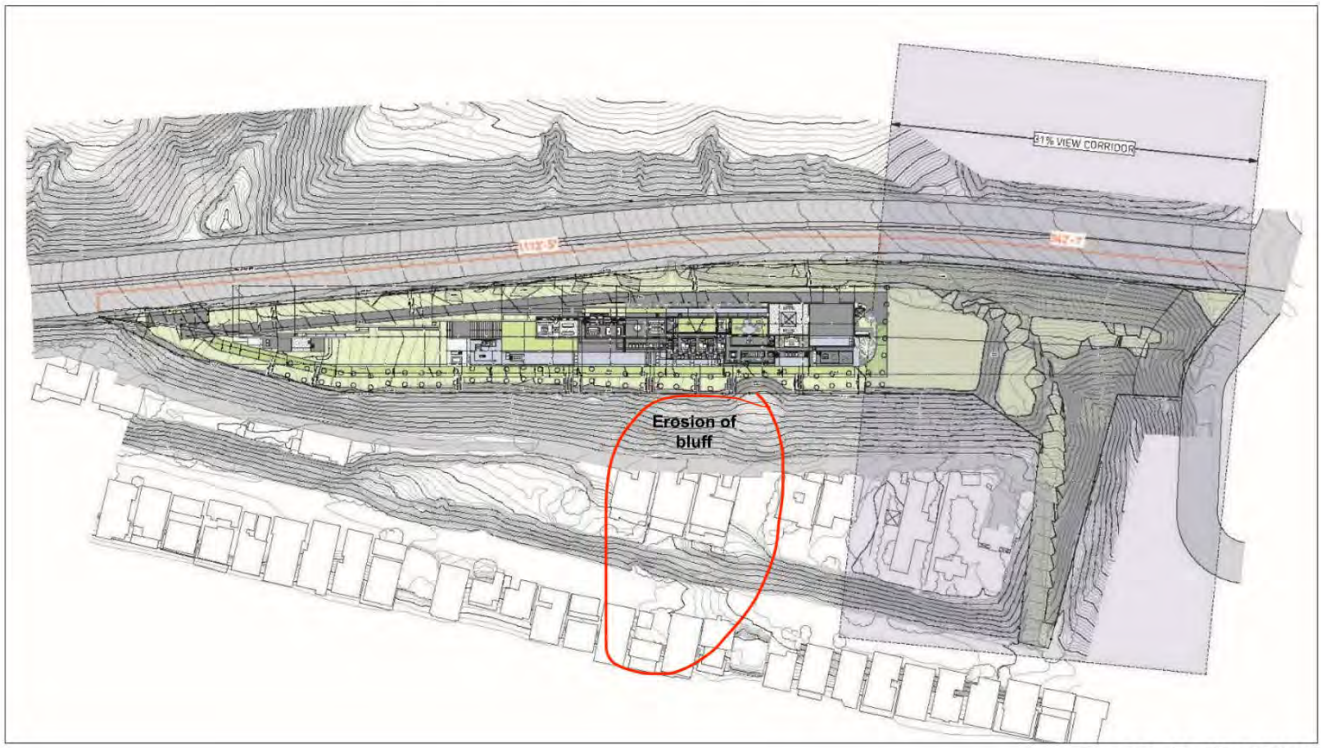
On the evening of January 6, 2021 an uncontrolled discharge from a watermain break near culvert MTD-10 caused erosion and partial slope failure from MTD-10 westward approximately 100 feet. The waterline is owned and maintained by Los Angeles County Waterworks District 29. Yeh was contacted by the City on January 7, 2021 and dispatched personnel onsite on January 7 and 8 to investigate potential impacts to district facilities. Yeh personnel surveyed slope inclinometers and did not

5

observe shear type movement. Yeh personnel noted that several district facilities were damaged or buried and after the event, maintained communication with the City and Water District to confirm repairs and recovery of the impacted assessment district facilities were completed. It should be noted that the slope behind MTD-10 and approximately 100 feet west remains in an over-steepened condition by the erosion and the slope may be susceptible to additional or more frequent erosion.

Malibu Road Landslide Assessment District Includes this entire parcel





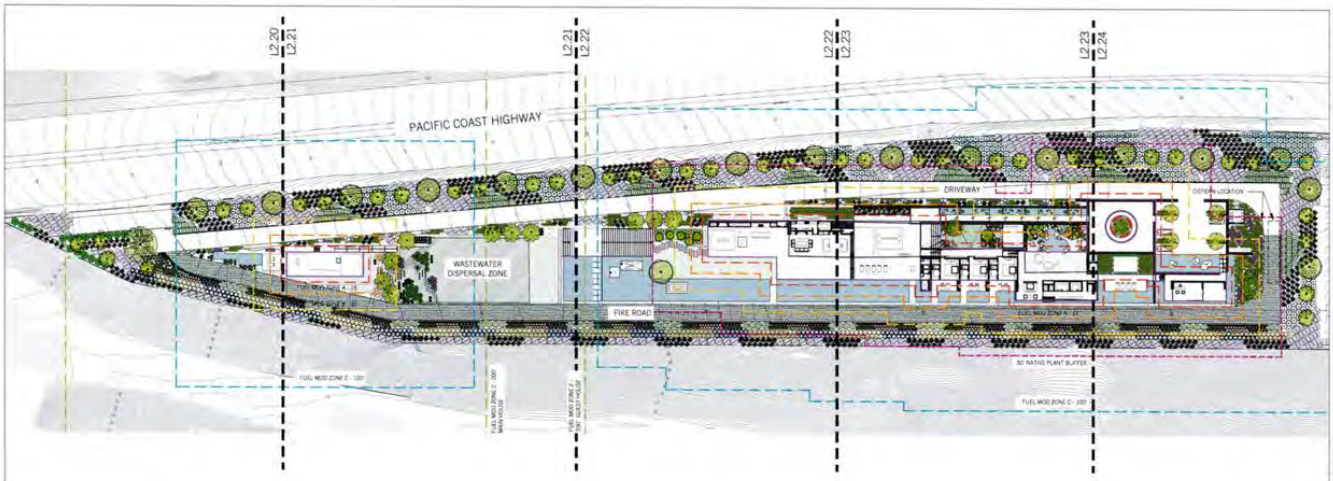


Figure 2 –Proposed Site Plan

Source: Project Plans

Please note at least 50 trees along the berm/PCH side that grow up to heights of 50 feet. This goes against the condition of landscaping not blocking any scenic views.

SHEET TITLE

OVERALL PLANTING PLAN

L2.02

D. New development proposed on landslides, steep slopes, unstable or weak soils or any other identified geologic hazard area, shall be permitted only where a factor of safety of 1.5 (static) and a factor of safety of 1.1 (pseudostatic) can be provided. Such analysis shall adhere to all provisions of the City of Malibu's "Guidelines for the preparation of engineering geologic and geotechnical engineering reports," dated February 2002. In addition, for the purpose of this section, quantitative slope stability analyses shall be undertaken as follows:

1. The analyses shall demonstrate a factor of safety greater than or equal to 1.5 for the static condition and greater than or equal to 1.1 for the seismic condition. Seismic analyses may be performed by the pseudostatic method, but in any case shall demonstrate a permanent displacement of less than 50 mm.

2. Slope stability analyses shall be undertaken through cross-sections modeling worst case geologic and slope gradient conditions. Analyses shall include postulated failure surfaces such that both the overall stability of the slope and the stability of the surficial units is examined.

3. The effects of earthquakes on slope stability (seismic stability) may be addressed through pseudostatic slope analyses assuming a horizontal seismic coefficient of 0.20g, and should be evaluated in conformance with the guidelines published by the American Society of Civil Engineers, Los Angeles Section (ASCE/SCEC), "Recommended Practices for Implementation of DMS Special Publication 117, Conditions for Analyzing and Mitigating Landslide Hazards in California."

4. All slope analyses shall be performed using shear strength parameters (friction angle and cohesion), and unit weights determined from relatively undisturbed samples collected at the site. The choice of shear strength parameters shall be supported by direct shear tests, triaxial shear test, or literature references.

5. All slope stability analyses shall be undertaken with water table or potentiometric surfaces for the highest potential ground water conditions.

6. If anisotropic conditions are assumed for any geologic unit, strike and dip of weakness planes shall be provided, and shear strength parameters for each orientation shall be supported by reference to pertinent direct sheer tests, triaxial shear test, or literature.

7. When planes of weakness are oriented normal to the slope or dip into the slope, or when the strength of materials is considered homogenous, circular failure surfaces shall be sought through a search routine to analyze the factor of safety along postulated critical failure surfaces. In general, methods that satisfy both force and moment equilibrium (e.g., Spencer, Morgenstern-Price, and General Limit Equilibrium) are preferred. Methods based on moment equilibrium alone (e.g., Bishop's Method) also are acceptable. In general, methods that solve only for

force equilibrium (e.g., Janbu's method) are discouraged due to their sensitivity to the ratio of normal to shear forces between slices.

8. If anisotropic conditions are assumed for units containing critical failure surfaces determined above, and when planes of weakness are inclined at angles ranging from nearly parallel to the slope to dipping out of slope, factors of safety for translational failure surfaces shall also be calculated. The use of a block failure model shall be supported by geologic evidence for anisotropy in rock or soil strength. Shear strength parameters for such weak surfaces shall be supported through direct shear tests, triaxial shear test, or literature references.

9. The selection of shear strength values is a critical component to the evluation of slope stability. Reference should be made to the City of Malibu's "Guidelines for the preparation of engineering geologic and geotechnical engineering reports," dated February 2002, and to the ASCE/SCEC guidelines (see Section 9.4.D.3 of the Malibu LIP) when selecting shear strength parameters and the selection should be based on these guidelines.

Response By: Feffer Geological, Dated June 18, 2020

Dear Mr. Weintraub:

As requested, Feffer Geological Consultants is providing this response to the referenced City of Malibu geotechnical review sheet.

We appreciate the opportunity to be of service. Should you have any questions regarding the information contained in this report, please do not hesitate to contact us.

Sincerely,

FEFFER GEOLOGICAL CONSULTING, INC.

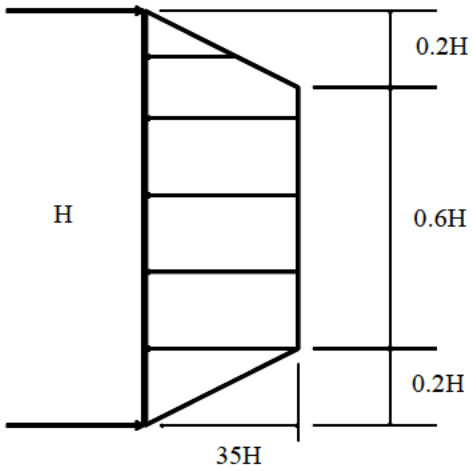
Distribution: Addressee– (1)

Item 1
Some of the cross-sections (example: 2-2' and B-B') show closely stacked retaining walls. The Project Geotechnical Consultant needs to evaluate the potential for interaction (example: lateral surcharge of lower retaining wall) between closely located retaining walls. Mitigation measures should be recommended, as necessary.



Note: The Project Geotechnical Consultant recommends in response to the above comment that, "Stacked retaining walls, where present, shall be designed such that the upper wall foundation extends below a 45-degree projection from the lowest retaining wall foundation. This will prevent the lateral surcharge between closely stacked retaining walls." Using the 1: 1 criterion for lateral surcharge is not acceptable for lateral surcharge unless substantiated by analyses and/or references. Footings below a 1:1 plane behind walls could laterally surcharge the walls. Lateral surcharge behind any proposed retaining walls need to be evaluated using an appropriate method (e.g.: 1- Spangler & Handy { 1982}, Soil Engineering, fourth Edition, Harper & Row, New York; 2- Navy Design Manual NAVFAC DM-7.2, Figures 11 & 12).

Response:
Stacked retaining walls are no longer planned as part of the development. Please see the updated plans and geotechnical map included in this response. The following recommendations should be used for the design of new retaining walls.

Retaining Walls

Cantilevered retaining walls up to 12 feet high that support fill, alluvium, bedrock, and approved retaining wall backfill, may be designed for an equivalent fluid pressure of 30 pounds per cubic foot (pcf) for level backslopes and 43 pcf for 2:1 (H:V) backslopes.

Restrained walls should be designed for an at-rest earth pressure of 54 pcf. Restrained braced retaining walls that are pinned at the top by a non-yielding floor should be designed for the trapezoidal pressure distribution noted in the figure below. The uniform trapezoidal pressure may be assumed over the central six tenths of the wall height. The pressure may be decreased to zero at the top and bottom of the wall.

Retaining walls should be provided with a subdrain or weepholes covered with a minimum of 12 inches of ¾ inch crushed gravel.

It is recommended that retaining walls be waterproofed. Waterproofing design and inspection of its installation is not the responsibility of the geotechnical engineer. A qualified waterproofing consultant should be retained to recommend a product or method, which would provide protection to below grade walls.

Cantilevered retaining walls higher than six feet need to consider a seismic surcharge from the Design Earthquake. The seismic surcharge should be calculated using a factor of safety of 1.0 with a horizontal seismic coefficient equal to 0.35g.

A seismic surcharge for retaining walls designed for active conditions is considered. For a 12-foot-high retaining wall with a level backslope, the static design force is equal to 2.16 kips (12ft^2 *30 pcf /2).

For a ground motion of 0.35g and a FS of 1.0, the enclosed calculations indicate an unbalanced force under seismic conditions from the Maximum Considered Earthquake is 299.6 pounds or 0.3 kips. Since the static design force is higher than the seismic force an additional seismic surcharge need not be added.

For a 12-foot-high retaining wall with a 2:1 backslope, the static design force is equal to 3.01 kips (12ft^2 *43 pcf /2).

For a ground motion of 0.35g and a FS of 1.0, the enclosed calculations indicate an unbalanced force under seismic conditions from the Maximum Considered Earthquake is 1,049 pounds or 1.05 kips. Since the static design force is higher than the seismic force an additional seismic surcharge need not be added.

Retaining Wall Backfill

Retaining wall backfill should be compacted to a minimum of 90 percent of the maximum density as determined by ASTM D 1557-14. It should be pointed out that the use of heavy compaction equipment in close proximity to retaining walls can result in excess wall movement and/or soil loadings exceeding design values. In this regard, care should be taken during backfilling operations.

Item 2
Please provide the infiltration report for the OWTS for review.

Response:
The report is included with this response.

Item 3
The Project Geotechnical Consultant needs to evaluate the effects effluent from the OWTS and irrigation may have on groundwater levels under the site and the potential to

adversely affect adjacent slopes and properties. Provide the supporting geologic report for the OWTS for review.

Response:
Please see the supporting geology report included with this response.

Item 4
The consultant needs to perform translational slope stability analyses on all cross-sections with potential adverse geologic conditions (examples: Cross-Sections 2-2', 3-3', 4-4', 5-5' and 6-6'). Substantiated residual shear strength (example: residual shear strength used for landslide planes) should be utilized to model along-bedding shear strength. Mitigation measures should be recommended, as necessary.

Response:
A letter titled *"Preliminary Slope Stability Analysis, 25200-25300 Pacific Coast Highway, Malibu, CA 90265"* dated March 25, 2021 was provided to the reviewers to open a discussion regarding the selection of appropriate shear values for use in the requested translational analyses. A copy of this letter is provided at the back of this response for the record.

A conference call was initiated between this firm and the reviewers to mutually review and agree on the selection of shear values. Based on that call and the presented letter, all parties agreed that the following values could be used for the translational analysis.

Material	Phi Angle (°)	Cohesion (psf)	Type
Bedrock	34.5	520	Ultimate
	41	720	Peak
	16	200	Back calc.

The ultimate value shall be used to model static conditions, and the peak value shall be used to model seismic conditions that apply a 0.35g horizontal acceleration. To model potential adverse bedding planes an anisotropic function shall be adopted for south dipping bedding planes ranging from 10 to 30 degrees and the selected residual value will be applied to this range of bedding planes for translational analysis. Groundwater was also modeled in the additional analyses where applicable.

Translational Stability Analysis
As requested, cross sections 2, 3, 4, 5 and 6 were analyzed for translational stability to model potential adverse geologic conditions. Each section was analyzed under the "post construction" condition to consider all proposed new grades, building loads, groundwater conditions, and reinforcements. Each analysis utilized the spencer method with a non-circular block search. Search windows were placed at the top and bottom of each slope based on a trial-and-error method of selection. Once search windows were defined, reinforcements were added to the slopes and modified until reaching a 1.5 and 1.0 factor of safety (FS) for static and seismic conditions.

The analyses indicate that the existing slopes require a stabilization system to achieve a 1.5 and 1.0 factor of safety and to mitigate potential geologic instability.

It should be noted that section 6-6' was not evaluated further because most of the slope for section 6-6' is within the delineated "No-Build Zone". As stated in previous responses, the proposed row of piles is only recommended to isolate the proposed development from the "No-Build Zone" and are not required to increase the global factor of safety for the slope. As illustrated on the updated translational analysis, all factors of safety less than 1.5 exist within the "No-Build Zone", do not intersect the proposed row of piles, and do not intersect the proposed development. The existing slope in this area is performing well under current conditions but should not be modified.

Pile Design Analysis

After performing the translational analyses, a separate set of analyses were performed for sections 2, 3, 4, and 5 to evaluate the pile loads needed to achieve a 1.5 and 1.0 FS for each portion of the slope. A discussion is provided below:

Offsite Slope

First, we evaluated the offsite portion of the slope from the southern property line to Bayshore Drive. The purpose of this analysis was to determine if the offsite portion of the slope had adequate factors of safety. A summary of the results is provided below:

Section	Static/Seismic	Factor of Safety
2-2'	Static	0.874
	Seismic	0.460
3-3'	Static	0.952
	Seismic	0.528
4-4'	Static	1.007
	Seismic	0.562
5-5'	Static	1.141
	Seismic	0.670

Offsite Slope Removal

Once we determined the existing FS for the offsite portion of the descending slope, the "failed" wedge of material was removed from each section until the FS was no longer less than 1.5 or 1.0 for static and seismic conditions.

The removal of this material left a freestanding portion of the piles at the property line. The purpose of this analysis was to evaluate the project site under the theoretical assumption that the descending slope failed away and left behind the slope stabilization system.

Due to the complexity of the site geology, the following analyses were used to determine the pile loads required to retain the project site in a post failure condition.

Upper Slope
Next, we evaluated the pile loads required to stabilize the site between the top of the slope and the bottom of the freestanding pile (determined from the analysis above) under static and seismic conditions. This required an iterative approach in which piles were added and loads were increased until achieving a 1.5 and 1.0 FS.

Entire Slope
Finally, to evaluate deep seated instability we evaluated the pile loads required to stabilize the site between the top of the slope and the bottom of the slope. This also required an iterative approach in which piles were added and loads were increased until achieving a 1.5 and 1.0 FS. A summary of the analyses and recommendations for the design of the stabilization system is provided on Table 1. The project engineer should use these values to design an appropriate stabilization system. A combination of grade beams, tiebacks, or other methods may be used to assist in the design to accommodate high pile loads.

Conclusion
The attached analyses indicate that the existing slopes require a stabilization system to achieve a 1.5 and 1.0 factor of safety and to mitigate potential geologic instability. Once reinforced, the slopes are considered grossly stable. The updated site map and cross sections illustrate the proposed locations of the support system.

The updated geotechnical map is color coded to illustrate the approximate proposed pile locations. Transitions between piles with different depths shall occur approximately at the midpoint between analyzed sections. The actual number of piles, their precise locations, and actual dimensions will be determined by the project Structural engineer given the information provided herein. Prior to submittal, the slope stabilization design and layout should be provided to this firm for review and approval.

Tieback Recommendations
Should the project Structural Engineer require the use of tiebacks, the following recommendations may be used in the design:

Soil Phi Angle: 34.5 degrees
Soil Cohesion Value: 520 psf
Seismic Coefficient: 0.35 g

The soil nail length, inclination, diameter, spacing, and number of tiebacks shall be determined by the designer to achieve the desired loads. The final design assumptions, calculations, and drawings should be reviewed by Feffer Geological Consulting.

Centralizers
Centralizers shall be installed along the length of the soil nail to ensure that the soil nail will be centered in the drill hole and that minimum grout cover encapsulates the rebar. Centralizers shall be manufactured from polyvinyl chloride (PVC), polyethylene (HDPE), polypropylene (HDPP), steel or other material that is non-detrimental to the pre-

stressing steel. Wood spacers shall not be used. The centralizer shall support the nail in the drill hole and position the nail so the required grout cover is achieved. All centralizers shall be designed to permit grout to flow freely around the nail and up the drill hole. Position centralizers should have a maximum center-to-center spacing that does not exceed 7.5 feet. Centralizers should also be located within 3 feet from the top and bottom of the drill hole.

Corrosion Protection
Production nails shall be corrosion protected. The best method for corrosion protection shall be determined by the designer.

Tieback Testing and Monitoring
An annual long-term monitoring plan should be implemented to inspect and record the performance of permanent tiebacks.

Performance Testing
Ten percent of the permanent tiebacks shall be performance tested to 200% of the design load. All testing shall be performed after the grout has cured for a minimum of 72 hours. Testing loads are never to exceed 200% of the design load.

The performance tests will involve the following cyclic loading sequence:

Cycle	**1**	**2**	**3**	**4**	**5**	**6**	**7**
%DL	AL	AL	AL	AL	AL	AL	AL
	25	25	25	25	25	25	25
	AL	50	50	50	50	50	50
		AL	75	75	75	75	75
			AL	100	100	100	100
				AL	125	125	125
					AL	150	150 - 10 or 60 minute hold
						AL	200 - 720 minute or 24 hour hold
							AL - 1 min. hold
							0.80 - look off
AL (alignment load ≈ 20% of the design load DL)							
DL (design load)							

Deformation measurements are to be taken at each load increment.

For the 10-minute hold test at 1.50 DL, measurements should be taken at the following intervals 0, 1, 2, 3, 4, 5, 6, and 10 minutes. The tieback is considered acceptable if the elongation is less than 0.04 inches. If the prescribed deformation is exceeded, the load should be held for an additional 50 minutes, and the movement readings should be recorded at 20, 30, 40, 50, and 60 minutes. If the creep rate from 6 to 60 minutes does not

exceed 0.08 inches and is decreasing (graph the logarithm of time versus creep movement) the tieback is considered acceptable.

For the 24-hour test at 2.0 DL, measurements should be taken at 6, 60, and 720 minutes. If the total creep movement after 720 minutes is less than 0.5 inches and the movement over the previous 4 hours is less than 0.1 inches, then the load test may be terminated and the tieback is considered acceptable. If the total deformation at 720 minutes exceeds 0.5 inches, then the test should be extended and a reading taken at 24 hours. tieback is considered acceptable if the total creep movement at 24 hours is less than 0.75 inches. Additionally, for the tieback to be considered acceptable, the total movement must exceed 80% of the theoretical elastic elongation of the unbounded length of the tendon to ensure that the unbounded length is not providing pullout resistance.

Proof Testing

Proof tests are to be performed on all remaining permanent tiebacks. All testing shall be performed after the grout has cured for a minimum of 72 hours. Testing loads are never to exceed 200% of the design load.

The proof tests will involve the following cyclic loading sequence:

AL / 0.25 DL / 0.50 DL / 0.75 DL / 1.00 DL / 1.25 DL / 1.50 DL - 10 or 60 min hold / AL / 0.80 DL - Look off

Additionally, 10% of the proof tests are to be tested under the following sequence:

AL / 0.25 DL / 0.50 DL / 0.75 DL / 1.00 DL / 1.25 DL / 1.50 DL / 2.0 DL - 30 min hold /AL / 0.80 DL - Look off

Deformation measurements are to be taken at each load increment.

For the 10-minute hold test at 1.50 DL measurements should be taken at the following intervals 0, 1,2, 3, 4, 5, 6, and 10 minutes. If the elongation is greater than 0.04 inches, the load should be held for an additional 50 minutes, and the movement readings recorded at 20, 30, 40, 50, and 60 minutes. If the creep rate in the period of time from 6 to 60 minutes does not exceed 0.08 inches and is decreasing (graph the logarithm of time versus creep movement) the tieback is considered to be acceptable.

For tiebacks subjected to the 30-minute hold test at 2.0 DL, measurements should be taken at the following intervals 0, 1, 2, 3, 4, 5, 6, 10, and 30 minutes. If the creep rate in the 30-minute test does not exceed 0.25 inches the tieback is considered acceptable.

Additionally, for the tieback to be considered acceptable the total movement must exceed 80% of the theoretical elastic elongation of the unbounded length of the tendon to ensure that the unbounded length is not providing pullout resistance.

If the tieback fails the test, it may be utilized at one half of the stabilized load, or there should be a replacement anchor installed. If several tiebacks fail, the construction

procedures or design recommendations are to be modified. The tieback plans are to reflect the testing requirements given above.

Performance Monitoring
Long-term performance monitoring shall be conducted for a period of 25 years. Five percent of the permanent tiebacks are to be monitored long-term with the Dynaforce load monitoring system. Monitoring shall comprise one set of readings at completion of the tieback construction and then every three months until readings stabilize, and once every two years.

If the load loss/gain in the monitored permanent tiebacks exceed 20 % of the design load, the possible causes of such variations are to be investigated to provide recommendations for future action, as necessary. Alternately, if after four years the load loss/gain is less than 10 % it is concluded the permanent tieback system is performing adequately; in which case monitoring may be terminated.

In addition, two inclinometers shall be installed near the northern and southern limits of the proposed permanent tiebacks. Inclinometers shall be monitored every two weeks during the construction phase of the project and every three months thereafter for a minimum of two years after the completion of the project.

The owner should retain the services of specialist consultants to monitor the forces in the permanent tiebacks and the movements within the inclinometers. Reading of the loads in the tiebacks and the movements of the inclinometers shall be processed by the specialist consultant and provided to the owner, the earth retention designer, and the City for review at the specified intervals.

Item 5
Please check the pile static EFP for Section 4-4' in the table for possible typing error.

Response:
Updated analyses have been performed and this item is no longer applicable.

GEOTECHNICAL REVIEW SHEET

Project Information

Date: August 4, 2020			**4165**
Site Address:	25200 Pacific Coast Highway		
Lot/Tract/PM #:	n/a	**Planning #:**	**CDP 19-012** PA 18-001
Applicant/Contact:	Cole Smith, csmith@weintraubre.com Jake Jesson, JJesson@weintraubre.com	**BPC/GPC #:**	
Contact Phone #:	949-878-6298 **Fax #:**	**Planner:**	**Adrian Fernandez**
Project Type:	New single-family residential development		

Submittal Information

Consultant(s)/Report Date(s): *(Current submittal(s) in **Bold**.)*	Feffer Geological Consulting (Daneshfar, RCE 68377; Feffer, CEG 2138): **6-18-2020**, 12-17-2019, 11-20-18, 5-21-18 EnSitu Engineering, Inc. (Yaroslaski, RCE 60149): **5-29-2020** **Architectural plans prepared by Oppenheim Architecture dated March 1, 2019.**
Previous Reviews:	1-29-2020, 1-14-19, 8-27-18

Review Findings

Coastal Development Permit Review

☐ The residential development project is **APPROVED** from a geotechnical perspective.

☒ The residential development project is **NOT APPROVED** from a geotechnical perspective. The listed 'Review Comments' shall be addressed prior to approval.

Building Plan-Check Stage Review

☒ Awaiting Building plan check submittal. Please respond to the listed 'Building Plan-Check Stage Review Comments' AND review and incorporate the attached 'Geotechnical Notes for Building Plan Check' into the plans.

☐ **APPROVED** from a geotechnical perspective. Please review the attached 'Geotechnical Notes for Building Plan Check' and incorporate into Building Plan-Check submittals.

☐ **NOT APPROVED** from a geotechnical perspective. The listed 'Building Plan-Check Stage Review Comments' shall be addressed prior to Building Plan-Check Stage approval.

Remarks

The referenced response geotechnical report, OWTS design report, and Architectural plans were reviewed by the City from a geotechnical perspective. The project, originally submitted as to the City as a Pre-Application (PA) for City geotechnical staff to review to determine if a single-family residential project is feasible on the property, has now been submitted to the City for a Coastal Development Permit (CDP). The project includes a new 9,808 square foot one-story single-family residence with a 2,881 square foot basement/garage, a detached 429 square foot guest bedroom, water features in the basement and the ground floor totaling 10,462 square feet, a swimming pool and plunge pool, covered terraces totaling

5,734 square feet, a tennis court, grading, and retaining walls. The OWTS consists of a treatment tank system and a 5,100 square foot subsurface irrigation dispersal field. The design flow is 1,050 gpd and the design loading rate is 0.206 gpsfd.

Review Comments:

1. Some of the cross-sections (example: 2-2' and B-B') show closely stacked retaining walls. The Project Geotechnical Consultant needs to evaluate the potential for interaction (example: lateral surcharge of lower retaining wall) between closely located retaining walls. Mitigation measures should be recommended, as necessary.

   Note: The Project Geotechnical Consultant recommends in response to the above comment that, "*Stacked retaining walls, where present, shall be designed such that the upper wall foundation extends below a 45-degree projection from the lowest retaining wall foundation. This will prevent the lateral surcharge between closely stacked retaining walls.*" Using the 1:1 criterion for lateral surcharge is not acceptable for lateral surcharge unless substantiated by analyses and/or references. Footings below a 1:1 plane behind walls could laterally surcharge the walls. Lateral surcharge behind any proposed retaining walls need to be evaluated using an appropriate method (e.g.: 1- Spangler & Handy {1982}, Soil Engineering, fourth Edition, Harper & Row, New York; 2- Navy Design Manual NAVFAC DM-7.2, Figures 11 & 12).

2. Please provide the infiltration report for the OWTS for review.

3. The Project Geotechnical Consultant needs to evaluate the effects effluent from the OWTS and irrigation may have on groundwater levels under the site and the potential to adversely affect adjacent slopes and properties. Provide the supporting geologic report for the OWTS for review.

4. The consultant needs to perform translational slope stability analyses on all cross-sections with potential adverse geologic conditions (examples: Cross-Sections 2-2', 3-3', 4-4', 5-5' and 6-6'). Substantiated residual shear strength (example: residual shear strength used for landslide planes) should be utilized to model along-bedding shear strength. Mitigation measures should be recommended, as necessary.

5. Please check the pile static EFP for Section 4-4' in the table for possible typing error.

Please direct questions regarding this review sheet to City Geotechnical staff listed below.

Engineering & Slope Stability

RETAINING WALL

IC: **1992-75** CONSULT: **AG**
CLIENT: **Colovea**

CALCULATION SHEET #

CALCULATE THE DESIGN MINIMUM EQUIVALENT FLUID PRESSURE (EFP) FOR PROPOSED RETAINING WALLS. THE WALL HEIGHT AND BACKSLOPE AND SURCHARGE CONDITIONS ARE LISTED BELOW. ASSUME THE BACKFILL IS SATURATED WITH NO EXCESS HYDROSTATIC PRESSURE. USE THE MONONOBE-OKABE METHOD FOR SEISMIC FORCES.

CALCULATION PARAMETERS

EARTH MATERIAL:	Bedrock	WALL HEIGHT	12 feet
SHEAR DIAGRAM:	B-13	BACKSLOPE ANGLE:	0 degrees
COHESION:	520 psf	SURCHARGE:	250 pounds
PHI ANGLE:	34.5 degrees	SURCHARGE TYPE:	U Uniform
DENSITY	124 pcf	INITIAL FAILURE ANGLE:	10 degrees
SAFETY FACTOR:	1.5	FINAL FAILURE ANGLE:	70 degrees
WALL FRICTION	10 degrees	INITIAL TENSION CRACK:	4 feet
CD (C/FS):	346.7 psf	FINAL TENSION CRACK:	12 feet

PHID = ATAN(TAN(PHI)/FS) = 24.6 degrees

HORIZONTAL PSEUDO STATIC SEISMIC COEFFICIENT (k_h) 0 %g

VERTICAL PSEUDO STATIC SEISMIC COEFFICIENT (k_v) 0 %g

CALCULATED RESULTS

CRITICAL FAILURE ANGLE	53 degrees
AREA OF TRIAL FAILURE WEDGE	37.4 square feet
TOTAL EXTERNAL SURCHARGE	0.0 pounds
WEIGHT OF TRIAL FAILURE WEDGE	4635.6 pounds
NUMBER OF TRIAL WEDGES ANALYZED	549 trials
LENGTH OF FAILURE PLANE	6.6 feet
DEPTH OF TENSION CRACK	6.7 feet
HORIZONTAL DISTANCE TO UPSLOPE TENSION CRACK	4.0 feet
CALCULATED HORIZONTAL THRUST ON WALL	**114.6 pounds**
CALCULATED EQUIVALENT FLUID PRESSURE	**1.6 pcf**
DESIGN EQUIVALENT FLUID PRESSURE	**30.0 pcf**

THE CALCULATION INDICATES THAT THE PROPOSED RETAINING WALL MAY BE DESIGNED FOR AN EQUIVALENT FLUID PRESSURE OF 30 POUNDS PER CUBIC FOOT.

RETAINING WALL

IC: **1992-75** CONSULT: **AG**
CLIENT: **Colovea**

CALCULATION SHEET #

CALCULATE THE DESIGN MINIMUM EQUIVALENT FLUID PRESSURE (EFP) FOR PROPOSED RETAINING WALLS. THE WALL HEIGHT AND BACKSLOPE AND SURCHARGE CONDITIONS ARE LISTED BELOW. ASSUME THE BACKFILL IS SATURATED WITH NO EXCESS HYDROSTATIC PRESSURE. USE THE MONONOBE-OKABE METHOD FOR SEISMIC FORCES.

CALCULATION PARAMETERS

EARTH MATERIAL:	Bedrock	WALL HEIGHT	12 feet
SHEAR DIAGRAM:	B-13	BACKSLOPE ANGLE:	0 degrees
COHESION:	520 psf	SURCHARGE:	250 pounds
PHI ANGLE:	34.5 degrees	SURCHARGE TYPE:	U Uniform
DENSITY	124 pcf	INITIAL FAILURE ANGLE:	10 degrees
SAFETY FACTOR:	1	FINAL FAILURE ANGLE:	70 degrees
WALL FRICTION	10 degrees	INITIAL TENSION CRACK:	4 feet
CD (C/FS):	520.0 psf	FINAL TENSION CRACK:	12 feet

PHID = ATAN(TAN(PHI)/FS) = 34.5 degrees

HORIZONTAL PSEUDO STATIC SEISMIC COEFFICIENT (k_h) 0.35 %g

VERTICAL PSEUDO STATIC SEISMIC COEFFICIENT (k_v) 0 %g

CALCULATED RESULTS

CRITICAL FAILURE ANGLE	48 degrees
AREA OF TRIAL FAILURE WEDGE	46.1 square feet
TOTAL EXTERNAL SURCHARGE	250.0 pounds
WEIGHT OF TRIAL FAILURE WEDGE	5968.6 pounds
NUMBER OF TRIAL WEDGES ANALYZED	549 trials
LENGTH OF FAILURE PLANE	7.5 feet
DEPTH OF TENSION CRACK	6.4 feet
HORIZONTAL DISTANCE TO UPSLOPE TENSION CRACK	5.0 feet
CALCULATED HORIZONTAL THRUST ON WALL	**299.6 pounds**

THE CALCULATION INDICATES THAT THE SEISMIC FORCE IS 0.3 KIPS WHICH IS LESS THAN THE STATIC RETAINING WALL PRESSURE. NO ADDITIONAL SEISMIC FORCE IS NEEDED.

RETAINING WALL

IC: **1992-75** CONSULT: **AG**
CLIENT: **Colovea**

CALCULATION SHEET #

CALCULATE THE DESIGN MINIMUM EQUIVALENT FLUID PRESSURE (EFP) FOR PROPOSED RETAINING WALLS. THE WALL HEIGHT AND BACKSLOPE AND SURCHARGE CONDITIONS ARE LISTED BELOW. ASSUME THE BACKFILL IS SATURATED WITH NO EXCESS HYDROSTATIC PRESSURE. USE THE MONONOBE-OKABE METHOD FOR SEISMIC FORCES.

SLIDEINTERPRET 9.018

Project	Section 2-2'		
Analysis Description	Translational (Static)		
Drawn By	A. Greene	Scale 1:610	Company Feffer Geological Consulting
Date			File Name Section 2-2' Translational Analysis_2.slmd

Slide Analysis Information

Section 2-2' Translational Analysis_2

Project Summary

File Name:	Section 2-2' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:00.500s
Project Title:	Section 2-2'
Analysis:	Translational (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Qlsr	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	200
Friction Angle [deg]	12
Water Surface	None
Ru Value	0
Fill (Af)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	0

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Pile 1 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	285000 lbs

Global Minimums

Method: spencer

FS	1.508460
Axis Location:	470.817, 241.704
Left Slip Surface Endpoint:	341.809, 130.917
Right Slip Surface Endpoint:	482.042, 72.025
Resisting Moment:	1.66476e+07 lb-ft
Driving Moment:	1.10362e+07 lb-ft
Resisting Horizontal Force:	88135.8 lb
Driving Horizontal Force:	58427.7 lb
Active Support Moment:	-4.6643e+06 lb-ft
Active Horizontal Support Force:	-26681.1 lb
Maximum Single Support Force:	28500 lb
Total Support Force:	28500 lb
Total Slice Area:	2222.36 ft2
Surface Horizontal Width:	140.233 ft
Surface Average Height:	15.8476 ft

Global Minimum Coordinates

Method: spencer

X	Y
341.809	130.917
355.871	110.048
474.087	65.6592
482.042	72.0252

Global Minimum Support Data

Method: spencer

Number of Supports: 1

Pile 1 (Static)

Support Type: Pile/Micro Pile

Start (x, y)	Length (ft)	L Inside SS (ft)	L Outside SS (ft)	Li (ft)	Lo (ft)	Force (lb)
385.532, 114.823	80	15.9122	64.0878	15.9122	64.0878	28500

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	2687
Number of Invalid Surfaces:	2313

Error Codes

Error Code -105 reported for 317 surfaces
Error Code -108 reported for 43 surfaces
Error Code -110 reported for 1513 surfaces
Error Code -111 reported for 440 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge

Slice Data

Global Minimum Query (spencer) - Safety Factor: 1.50846

Slide Analysis Information

Section 2-2' Translational Analysis_2

Project Summary

File Name:	Section 2-2' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:00.634s
Project Title:	Section 2-2'
Analysis:	Translational (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Qlsr	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	200
Friction Angle [deg]	12
Water Surface	None
Ru Value	0
Fill (Af)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	1.25e+06 lbs

Global Minimums

Method: spencer

FS	1.003020
Axis Location:	423.860, 320.374
Left Slip Surface Endpoint:	259.755, 127.874
Right Slip Surface Endpoint:	479.396, 73.590
Resisting Moment:	5.09418e+07 lb-ft
Driving Moment:	5.07886e+07 lb-ft
Resisting Horizontal Force:	204789 lb
Driving Horizontal Force:	204173 lb
Active Support Moment:	-2.93672e+07 lb-ft
Active Horizontal Support Force:	-122684 lb
Maximum Single Support Force:	125000 lb
Total Support Force:	125000 lb
Total Slice Area:	5173.74 ft2
Surface Horizontal Width:	219.642 ft
Surface Average Height:	23.5553 ft

Global Minimum Coordinates

Method: spencer

X	Y
259.755	127.874
270.174	111.006
475.224	70.9727
479.396	73.5896

Global Minimum Support Data

Method: spencer

Number of Supports: 1

Pile 1 (Seismic)

Support Type: Pile/Micro Pile

Start (x, y)	Length (ft)	L Inside SS (ft)	L Outside SS (ft)	Li (ft)	Lo (ft)	Force (lb)
385.532, 114.823	101.839	26.3392	75.4998	26.3392	75.4998	125000

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	1872
Number of Invalid Surfaces:	3128

Error Codes

Error Code -105 reported for 283 surfaces
Error Code -108 reported for 26 surfaces
Error Code -110 reported for 1519 surfaces
Error Code -111 reported for 1266 surfaces
Error Code -112 reported for 34 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

Slice Data

Global Minimum Query (spencer) - Safety Factor: 1.00302

Slide Analysis Information

Section 2-2' Translational Analysis_2

Project Summary

File Name:	Section 2-2' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:08.130s
Project Title:	Section 2-2'
Analysis:	Offiste Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	21428
Number of Invalid Surfaces:	3627

Error Codes

Error Code -106 reported for 27 surfaces
Error Code -108 reported for 112 surfaces
Error Code -110 reported for 356 surfaces
Error Code -111 reported for 646 surfaces
Error Code -112 reported for 220 surfaces
Error Code -121 reported for 510 surfaces
Error Code -145 reported for 14 surfaces
Error Code -1000 reported for 1742 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Date				File Name	Section 2-2' Translational Analysis_2.slmd

Slide Analysis Information

Section 2-2' Translational Analysis_2

Project Summary

File Name:	Section 2-2' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:15.640s
Project Title:	Section 2-2'
Analysis:	Offiste Slope (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Qlsr	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	200
Friction Angle [deg]	12
Water Surface	None
Ru Value	0
Fill (Af)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	1.25e+06 lbs

Global Minimums

Method: spencer

FS	0.460352
Axis Location:	487.316, 195.433
Left Slip Surface Endpoint:	386.119, 114.595
Right Slip Surface Endpoint:	491.268, 65.972
Resisting Moment:	7.35657e+06 lb-ft
Driving Moment:	1.59803e+07 lb-ft
Resisting Horizontal Force:	51376 lb
Driving Horizontal Force:	111602 lb
Total Slice Area:	1608.99 ft2
Surface Horizontal Width:	105.15 ft
Surface Average Height:	15.3019 ft

Global Minimum Coordinates

Method: spencer

X	Y
386.119	114.595
394.373	102.824
407.892	90.3085
427.595	78.6592
448.781	70.3551
471.586	66.0769
482.493	65.7462
491.268	65.972

Global Minimum Support Data

Method: spencer

Number of Supports: 1

Pile 1 (Seismic)

Support Type: Pile/Micro Pile

Start (x, y)	Length (ft)	L Inside SS (ft)	L Outside SS (ft)	Li (ft)	Lo (ft)	Force (lb)
385.532, 114.823	99.296	Not Effective	Not Effective	Not Effective	Not Effective	0

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	18108
Number of Invalid Surfaces:	6951

Error Codes

Error Code -106 reported for 36 surfaces
Error Code -108 reported for 27 surfaces
Error Code -109 reported for 15 surfaces
Error Code -110 reported for 310 surfaces
Error Code -111 reported for 1200 surfaces
Error Code -112 reported for 136 surfaces
Error Code -121 reported for 695 surfaces
Error Code -145 reported for 23 surfaces
Error Code -1000 reported for 4509 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Section 2-2' Translational Analysis_2

Project Summary

File Name:	Section 2-2' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:16.407s
Project Title:	Section 2-2'
Analysis:	Offiste Slope Removal (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Error Codes

Error Code -106 reported for 19 surfaces
Error Code -108 reported for 391 surfaces
Error Code -109 reported for 2 surfaces
Error Code -110 reported for 444 surfaces
Error Code -111 reported for 2620 surfaces
Error Code -112 reported for 220 surfaces
Error Code -121 reported for 111 surfaces
Error Code -145 reported for 38 surfaces
Error Code -1000 reported for 7485 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Date			File Name Section 2-2' Translational Analysis_2.slmd

Slide Analysis Information

Section 2-2' Translational Analysis_2

Project Summary

File Name:	Section 2-2' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:21.936s
Project Title:	Section 2-2'
Analysis:	Offiste Slope Removal (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Qlsr	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	200
Friction Angle [deg]	12
Water Surface	None
Ru Value	0
Fill (Af)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile 1 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	285000 lbs

Global Minimums

Method: spencer

FS	1.403720
Axis Location:	413.359, 109.284
Left Slip Surface Endpoint:	385.585, 91.115
Right Slip Surface Endpoint:	411.230, 76.163
Resisting Moment:	346800 lb-ft
Driving Moment:	247058 lb-ft
Resisting Horizontal Force:	7895.68 lb
Driving Horizontal Force:	5624.83 lb
Total Slice Area:	101.783 ft2
Surface Horizontal Width:	25.6453 ft
Surface Average Height:	3.96887 ft

Global Minimum Coordinates

Method: spencer

Number of Valid Surfaces:	20293
Number of Invalid Surfaces:	4768

Error Codes

Error Code -106 reported for 34 surfaces
Error Code -108 reported for 74 surfaces
Error Code -109 reported for 5 surfaces
Error Code -110 reported for 580 surfaces
Error Code -111 reported for 779 surfaces
Error Code -112 reported for 100 surfaces
Error Code -121 reported for 83 surfaces
Error Code -124 reported for 1 surface
Error Code -145 reported for 23 surfaces
Error Code -1000 reported for 3089 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Slice Data

Slide Analysis Information

Section 2-2' Translational Analysis_2

Project Summary

File Name:	Section 2-2' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:12.354s
Project Title:	Section 2-2'
Analysis:	Upper Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Qlsr	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	200
Friction Angle [deg]	12
Water Surface	None
Ru Value	0
Fill (Af)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	0

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Pile 1_Reinforced (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	180000 lbs

Pile 2_Reinforced (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	210000 lbs

Global Minimums

Method: spencer

FS	1.500310
Axis Location:	392.188, 177.261
Left Slip Surface Endpoint:	319.303, 130.917
Right Slip Surface Endpoint:	385.532, 91.146
Left Slope Intercept:	319.303 130.917
Right Slope Intercept:	385.532 114.823
Resisting Moment:	4.03343e+06 lb-ft
Driving Moment:	2.68893e+06 lb-ft
Resisting Horizontal Force:	44583.2 lb
Driving Horizontal Force:	29721.9 lb
Active Support Moment:	-3.03888e+06 lb-ft
Active Horizontal Support Force:	-33778.4 lb
Maximum Single Support Force:	21000 lb
Total Support Force:	39000 lb
Total Slice Area:	1159.95 ft2
Surface Horizontal Width:	66.2291 ft
Surface Average Height:	17.5143 ft

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	15585
Number of Invalid Surfaces:	9470

Error Codes

Error Code -108 reported for 184 surfaces
Error Code -110 reported for 595 surfaces
Error Code -111 reported for 6479 surfaces
Error Code -112 reported for 245 surfaces
Error Code -113 reported for 1 surface
Error Code -121 reported for 997 surfaces
Error Code -124 reported for 4 surfaces
Error Code -145 reported for 3 surfaces
Error Code -1000 reported for 962 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-113 = Surface intersects outside slope limits.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Slice Data

Slide Analysis Information

Section 2-2' Translational Analysis_2

Project Summary

File Name:	Section 2-2' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:22.933s
Project Title:	Section 2-2'
Analysis:	Upper Slope (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)

Support

Pile 1_Reinforced (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	200000 lbs

Pile 2_Reinforced (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	770000 lbs

Global Minimums

Method: spencer

FS	1.008370
Axis Location:	348.592, 287.699
Left Slip Surface Endpoint:	213.513, 140.215
Right Slip Surface Endpoint:	385.532, 91.146
Left Slope Intercept:	213.513 140.215
Right Slope Intercept:	385.532 114.823
Resisting Moment:	3.13147e+07 lb-ft
Driving Moment:	3.10548e+07 lb-ft
Resisting Horizontal Force:	163173 lb
Driving Horizontal Force:	161819 lb
Active Support Moment:	-1.81516e+07 lb-ft
Active Horizontal Support Force:	-95520.8 lb
Maximum Single Support Force:	77000 lb
Total Support Force:	97000 lb
Total Slice Area:	3987.72 ft2
Surface Horizontal Width:	172.019 ft
Surface Average Height:	23.1819 ft

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	9013
Number of Invalid Surfaces:	16061

Error Codes

Error Code -108 reported for 176 surfaces
Error Code -110 reported for 6559 surfaces
Error Code -111 reported for 4819 surfaces
Error Code -112 reported for 665 surfaces
Error Code -113 reported for 1 surface
Error Code -121 reported for 228 surfaces
Error Code -124 reported for 16 surfaces
Error Code -145 reported for 11 surfaces
Error Code -1000 reported for 3586 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-113 = Surface intersects outside slope limits.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Date				File Name	Section 2-2' Translational Analysis_2.slmd

Slide Analysis Information

Section 2-2' Translational Analysis_2

Project Summary

File Name:	Section 2-2' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:12.120s
Project Title:	Section 2-2'
Analysis:	Upper Slope (Static) 1
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes

Error Codes

Error Code -108 reported for 173 surfaces
Error Code -109 reported for 1 surface
Error Code -111 reported for 2051 surfaces
Error Code -112 reported for 290 surfaces
Error Code -113 reported for 1 surface
Error Code -121 reported for 296 surfaces
Error Code -124 reported for 3 surfaces
Error Code -145 reported for 16 surfaces
Error Code -1000 reported for 1489 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-113 = Surface intersects outside slope limits.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Slide Analysis Information

Section 2-2' Translational Analysis_2

Project Summary

File Name:	Section 2-2' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:15.817s
Project Title:	Section 2-2'
Analysis:	Upper Slope (Seismic) 1
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	9.81
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Qlsr	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	200
Friction Angle [deg]	12
Water Surface	None
Ru Value	0
Fill (Af)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	None
Ru Value	0

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile 1 (Seismic)_1	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	500000 lbs

Pile 2 (Seismic)_1	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	1.3e+06 lbs

Global Minimums

Method: spencer

FS	1.005040
Axis Location:	388.077, 348.844
Left Slip Surface Endpoint:	193.481, 146.829
Right Slip Surface Endpoint:	432.931, 71.958
Resisting Moment:	7.10586e+07 lb-ft
Driving Moment:	7.0702e+07 lb-ft
Resisting Horizontal Force:	256325 lb
Driving Horizontal Force:	255038 lb
Active Support Moment:	-4.78705e+07 lb-ft
Active Horizontal Support Force:	-177262 lb
Maximum Single Support Force:	130000 lb
Total Support Force:	180000 lb
Total Slice Area:	6428.7 ft2
Surface Horizontal Width:	239.45 ft
Surface Average Height:	26.8477 ft

Global Minimum Coordinates

Method: spencer

Pile 2 (Seismic)_1

Support Type: Pile/Micro Pile

Start (x, y)	Length (ft)	L Inside SS (ft)	L Outside SS (ft)	Li (ft)	Lo (ft)	Force (lb)
361.373, 130.917	111.6	47.4168	64.1832	47.4168	64.1832	130000

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces: 15230
Number of Invalid Surfaces: 9834

Error Codes

Error Code -108 reported for 88 surfaces
Error Code -109 reported for 1 surface
Error Code -111 reported for 5612 surfaces
Error Code -112 reported for 397 surfaces
Error Code -113 reported for 1 surface
Error Code -121 reported for 1076 surfaces
Error Code -124 reported for 26 surfaces
Error Code -145 reported for 24 surfaces
Error Code -1000 reported for 2609 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-113 = Surface intersects outside slope limits.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Slice Data

Slide Analysis Information

Section 3-3' Translational Analysis_2

Project Summary

File Name:	Section 3-3' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:00.437s
Project Title:	Section 3-3'
Analysis:	Translational (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Pile 1 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	345000 lbs

Global Minimums

Method: spencer

FS	1.501680
Axis Location:	471.369, 263.119
Left Slip Surface Endpoint:	324.701, 130.073
Right Slip Surface Endpoint:	489.805, 65.958
Resisting Moment:	2.18087e+07 lb-ft
Driving Moment:	1.45229e+07 lb-ft
Resisting Horizontal Force:	111074 lb
Driving Horizontal Force:	73966.6 lb
Active Support Moment:	-6.20664e+06 lb-ft
Active Horizontal Support Force:	-31767.8 lb
Maximum Single Support Force:	34500 lb
Total Support Force:	34500 lb
Total Slice Area:	2442.03 ft2
Surface Horizontal Width:	165.104 ft
Surface Average Height:	14.7909 ft

Global Minimum Coordinates

Method: spencer

X	Y
324.701	130.073
324.89	129.788
483.472	62.6174
489.805	65.9575

Global Minimum Support Data

Method: spencer

Number of Supports: 1

Pile 1 (Static)

Support Type: Pile/Micro Pile

Start (x, y)	Length (ft)	L Inside SS (ft)	L Outside SS (ft)	Li (ft)	Lo (ft)	Force (lb)
391.679, 128.135	110.937	26.6371	84.2999	26.6371	84.2999	34500

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	1637
Number of Invalid Surfaces:	3363

Error Codes

Error Code -105 reported for 490 surfaces
Error Code -108 reported for 25 surfaces
Error Code -110 reported for 2352 surfaces
Error Code -111 reported for 496 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge

Slice Data

Slide Analysis Information

Section 3-3' Translational Analysis_2

Project Summary

File Name:	Section 3-3' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:00.793s
Project Title:	Section 3-3'
Analysis:	Translational (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	None
Ru Value	0

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	88500 lbs

Global Minimums

Method: spencer

FS	1.039610
Axis Location:	427.801, 285.757
Left Slip Surface Endpoint:	285.770, 130.073
Right Slip Surface Endpoint:	467.130, 78.722
Resisting Moment:	4.81229e+07 lb-ft
Driving Moment:	4.62891e+07 lb-ft
Resisting Horizontal Force:	224909 lb
Driving Horizontal Force:	216339 lb
Active Support Moment:	-1.73556e+06 lb-ft
Active Horizontal Support Force:	-8675.77 lb
Maximum Single Support Force:	8850 lb
Total Support Force:	8850 lb
Total Slice Area:	4062.34 ft2
Surface Horizontal Width:	181.36 ft
Surface Average Height:	22.3993 ft

Global Minimum Coordinates

Method: spencer

X	Y
285.77	130.073
296.724	112.111
465.762	78.0647
467.13	78.7222

Global Minimum Support Data

Method: spencer

Number of Supports: 1

Pile 1 (Seismic)

Support Type: Pile/Micro Pile

Start (x, y)	Length (ft)	L Inside SS (ft)	L Outside SS (ft)	Li (ft)	Lo (ft)	Force (lb)
391.679, 128.135	109.404	35.1491	74.2549	35.1491	74.2549	8850

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	3269
Number of Invalid Surfaces:	1731

Error Codes

Error Code -105 reported for 490 surfaces
Error Code -108 reported for 34 surfaces
Error Code -111 reported for 991 surfaces
Error Code -112 reported for 216 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

Slice Data

Section 3-3' Translational Analysis_2

Project Summary

File Name:	Section 3-3' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:03.794s
Project Title:	Section 3-3'
Analysis:	Offsite Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Bishop simplified
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Pile 1 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	345000 lbs

Global Minimums

Method: bishop simplified

FS	0.951926
Axis Location:	501.429, 192.142
Left Slip Surface Endpoint:	391.787, 128.067
Right Slip Surface Endpoint:	486.904, 65.983
Resisting Moment:	8.58885e+06 lb-ft
Driving Moment:	9.02261e+06 lb-ft
Total Slice Area:	1287.09 ft2
Surface Horizontal Width:	95.1174 ft
Surface Average Height:	13.5316 ft

Global Minimum Coordinates

Method: bishop simplified

Valid and Invalid Surfaces

Method: bishop simplified

Number of Valid Surfaces:	15193
Number of Invalid Surfaces:	9863

Error Codes

Error Code -106 reported for 37 surfaces
Error Code -108 reported for 56 surfaces
Error Code -109 reported for 1 surface
Error Code -110 reported for 436 surfaces
Error Code -111 reported for 3297 surfaces
Error Code -112 reported for 252 surfaces
Error Code -121 reported for 1323 surfaces
Error Code -124 reported for 2 surfaces
Error Code -145 reported for 21 surfaces
Error Code -1000 reported for 4438 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Section 3-3' Translational Analysis_2

Project Summary

File Name:	Section 3-3' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:02.542s
Project Title:	Section 3-3'
Analysis:	Offsite Slope (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Bishop simplified
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	None
Ru Value	0

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	88500 lbs

Global Minimums

Method: bishop simplified

FS	0.527680
Axis Location:	501.435, 192.198
Left Slip Surface Endpoint:	391.744, 128.094
Right Slip Surface Endpoint:	486.904, 65.983
Resisting Moment:	7.69063e+06 lb-ft
Driving Moment:	1.45744e+07 lb-ft
Total Slice Area:	1313.93 ft2
Surface Horizontal Width:	95.1595 ft
Surface Average Height:	13.8077 ft

Global Minimum Coordinates

Valid and Invalid Surfaces

Method: bishop simplified

Number of Valid Surfaces:	18139
Number of Invalid Surfaces:	6917

Error Codes

Error Code -106 reported for 18 surfaces
Error Code -108 reported for 34 surfaces
Error Code -109 reported for 1 surface
Error Code -111 reported for 359 surfaces
Error Code -112 reported for 302 surfaces
Error Code -121 reported for 1605 surfaces
Error Code -124 reported for 1 surface
Error Code -145 reported for 13 surfaces
Error Code -1000 reported for 4584 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Section 3-3' Translational Analysis_2

Project Summary

File Name:	Section 3-3' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:06.465s
Project Title:	Section 3-3'
Analysis:	Offiste Slope Removal (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Bishop simplified
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Pile 1 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	345000 lbs

Global Minimums

Method: bishop simplified

FS	2.330700
Axis Location:	424.890, 118.938
Left Slip Surface Endpoint:	391.732, 95.767
Right Slip Surface Endpoint:	423.532, 78.509
Resisting Moment:	778357 lb-ft
Driving Moment:	333959 lb-ft
Total Slice Area:	179.612 ft2
Surface Horizontal Width:	31.8005 ft
Surface Average Height:	5.64809 ft

Global Minimum Coordinates

Valid and Invalid Surfaces

Method: bishop simplified

Number of Valid Surfaces:	16243
Number of Invalid Surfaces:	8826

Error Codes

Error Code -106 reported for 30 surfaces
Error Code -108 reported for 44 surfaces
Error Code -110 reported for 541 surfaces
Error Code -111 reported for 307 surfaces
Error Code -112 reported for 347 surfaces
Error Code -121 reported for 78 surfaces
Error Code -145 reported for 28 surfaces
Error Code -1000 reported for 7451 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Slice Data

Slide Analysis Information

Section 3-3' Translational Analysis_2

Project Summary

File Name:	Section 3-3' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:03.96s
Project Title:	Section 3-3'
Analysis:	Offiste Slope Removal (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Bishop simplified
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Valid and Invalid Surfaces

Method: bishop simplified

Number of Valid Surfaces:	16909
Number of Invalid Surfaces:	8150

Error Codes

Error Code -106 reported for 17 surfaces
Error Code -108 reported for 20 surfaces
Error Code -111 reported for 283 surfaces
Error Code -112 reported for 236 surfaces
Error Code -121 reported for 64 surfaces
Error Code -124 reported for 1 surface
Error Code -145 reported for 15 surfaces
Error Code -1000 reported for 7514 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Section 3-3' Translational Analysis_2

Project Summary

File Name:	Section 3-3' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:15.832s
Project Title:	Section 3-3'
Analysis:	Upper Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Upper Slope Pile 1 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	165000 lbs

Upper Slope Pile 2 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	163000 lbs

Global Minimums

Method: spencer

FS	1.507980
Axis Location:	399.643, 165.558
Left Slip Surface Endpoint:	339.056, 130.073
Right Slip Surface Endpoint:	391.679, 95.798
Left Slope Intercept:	339.056 130.073
Right Slope Intercept:	391.679 128.135
Resisting Moment:	2.71968e+06 lb-ft
Driving Moment:	1.80353e+06 lb-ft
Resisting Horizontal Force:	36038.3 lb
Driving Horizontal Force:	23898.5 lb
Active Support Moment:	-2.11299e+06 lb-ft
Active Horizontal Support Force:	-28420.1 lb
Maximum Single Support Force:	16500 lb
Total Support Force:	32800 lb
Total Slice Area:	1003.7 ft2
Surface Horizontal Width:	52.6225 ft
Surface Average Height:	19.0735 ft

Global Minimum Coordinates

Method: spencer

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	14023
Number of Invalid Surfaces:	11031

Error Codes

Error Code -106 reported for 17 surfaces
Error Code -108 reported for 149 surfaces
Error Code -109 reported for 5 surfaces
Error Code -110 reported for 109 surfaces
Error Code -111 reported for 4304 surfaces
Error Code -112 reported for 55 surfaces
Error Code -121 reported for 581 surfaces
Error Code -145 reported for 31 surfaces
Error Code -1000 reported for 5780 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Slice Data

Project Summary

File Name:	Section 3-3' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:09.876s
Project Title:	Section 3-3'
Analysis:	Upper Slope (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	None
Ru Value	0

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Upper Slope Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	400000 lbs

Upper Slope Pile 2 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	319000 lbs

Global Minimums

Method: spencer

FS	1.007250
Axis Location:	368.555, 225.141
Left Slip Surface Endpoint:	278.904, 128.997
Right Slip Surface Endpoint:	391.679, 95.734
Left Slope Intercept:	278.904 130.073
Right Slope Intercept:	391.679 128.135
Resisting Moment:	1.17834e+07 lb-ft
Driving Moment:	1.16987e+07 lb-ft
Resisting Horizontal Force:	93518.8 lb
Driving Horizontal Force:	92846.9 lb
Active Support Moment:	-8.48825e+06 lb-ft
Active Horizontal Support Force:	-69123.5 lb
Maximum Single Support Force:	40000 lb
Total Support Force:	71900 lb
Total Slice Area:	2329.14 ft2
Surface Horizontal Width:	112.775 ft
Surface Average Height:	20.653 ft

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	14724
Number of Invalid Surfaces:	10337

Error Codes

Error Code -106 reported for 33 surfaces
Error Code -108 reported for 103 surfaces
Error Code -109 reported for 2 surfaces
Error Code -111 reported for 2593 surfaces
Error Code -112 reported for 152 surfaces
Error Code -121 reported for 1084 surfaces
Error Code -124 reported for 1 surface
Error Code -145 reported for 21 surfaces
Error Code -1000 reported for 6348 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Slide Analysis Information

Section 3-3' Translational Analysis_2

Project Summary

File Name:	Section 3-3' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:10.837s
Project Title:	Section 3-3'
Analysis:	Entire Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Entire Slope Pile 1 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	648500 lbs

Global Minimums

Method: spencer

FS	1.515010

Error Codes

Error Code -106 reported for 7 surfaces
Error Code -108 reported for 143 surfaces
Error Code -110 reported for 2622 surfaces
Error Code -111 reported for 1567 surfaces
Error Code -112 reported for 220 surfaces
Error Code -121 reported for 606 surfaces
Error Code -124 reported for 4 surfaces
Error Code -145 reported for 61 surfaces
Error Code -1000 reported for 2539 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Section 3-3' Translational Analysis_2

Project Summary

File Name:	Section 3-3' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:12.454s
Project Title:	Section 3-3'
Analysis:	Entire Slope (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	None
Ru Value	0

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Enitre Slope Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	753000 lbs

Entire Slope Pile 2 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	700000 lbs

Global Minimums

Method: spencer

FS	1.000330
Axis Location:	412.999, 375.135
Left Slip Surface Endpoint:	203.868, 143.139
Right Slip Surface Endpoint:	473.117, 68.633
Resisting Moment:	7.21736e+07 lb-ft
Driving Moment:	7.21497e+07 lb-ft
Resisting Horizontal Force:	240833 lb
Driving Horizontal Force:	240753 lb
Active Support Moment:	-4.23389e+07 lb-ft
Active Horizontal Support Force:	-143089 lb
Maximum Single Support Force:	75300 lb
Total Support Force:	145300 lb
Total Slice Area:	5842.51 ft2
Surface Horizontal Width:	269.249 ft
Surface Average Height:	21.6993 ft

Global Minimum Coordinates

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	13586
Number of Invalid Surfaces:	11476

Error Codes

Error Code -106 reported for 9 surfaces
Error Code -108 reported for 95 surfaces
Error Code -109 reported for 4 surfaces
Error Code -111 reported for 3335 surfaces
Error Code -112 reported for 259 surfaces
Error Code -121 reported for 2385 surfaces
Error Code -124 reported for 20 surfaces
Error Code -145 reported for 15 surfaces
Error Code -1000 reported for 5354 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Slide Analysis Information

Section 4-4' Translational Analysis_2

Project Summary

File Name:	Section 4-4' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:00.548s
Project Title:	Section 4-4'
Analysis:	Translational (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Pile1 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	190000 lbs

Global Minimums

Method: spencer

FS	1.507900
Axis Location:	421.904, 214.335
Left Slip Surface Endpoint:	305.562, 123.040
Right Slip Surface Endpoint:	425.134, 66.484
Resisting Moment:	1.32778e+07 lb-ft
Driving Moment:	8.80551e+06 lb-ft
Resisting Horizontal Force:	85492.5 lb
Driving Horizontal Force:	56696.3 lb
Active Support Moment:	-2.65646e+06 lb-ft
Active Horizontal Support Force:	-17969.7 lb
Maximum Single Support Force:	19000 lb
Total Support Force:	19000 lb
Total Slice Area:	1915.99 ft2
Surface Horizontal Width:	119.573 ft
Surface Average Height:	16.0237 ft

Global Minimum Coordinates

Method: spencer

X	Y
305.562	123.04
316.184	102.815
423.954	65.8004
425.134	66.484

Global Minimum Support Data

Method: spencer

Number of Supports: 1

Pile1 (Static)

Support Type: Pile/Micro Pile

Start (x, y)	Length (ft)	L Inside SS (ft)	L Outside SS (ft)	Li (ft)	Lo (ft)	Force (lb)
353.562, 114.069	101.374	24.0924	77.2816	24.0924	77.2816	19000

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	2814
Number of Invalid Surfaces:	2186

Error Codes

Error Code -105 reported for 147 surfaces
Error Code -108 reported for 46 surfaces
Error Code -110 reported for 1308 surfaces
Error Code -111 reported for 681 surfaces
Error Code -112 reported for 4 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

Slide Analysis Information

Section 4-4' Translational Analysis_2

Project Summary

File Name:	Section 4-4' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:00.645s
Project Title:	Section 4-4'
Analysis:	Translational (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	200000 lbs

Global Minimums

Method: spencer

FS	0.999995
Axis Location:	421.629, 331.029
Left Slip Surface Endpoint:	236.659, 115.923
Right Slip Surface Endpoint:	482.732, 53.989
Resisting Moment:	8.42383e+07 lb-ft
Driving Moment:	8.42387e+07 lb-ft
Resisting Horizontal Force:	295772 lb
Driving Horizontal Force:	295774 lb
Active Support Moment:	-5.27517e+06 lb-ft
Active Horizontal Support Force:	-19543.9 lb
Maximum Single Support Force:	20000 lb
Total Support Force:	20000 lb

Number of Invalid Surfaces:	3041

Error Codes

Error Code -105 reported for 148 surfaces
Error Code -108 reported for 29 surfaces
Error Code -110 reported for 1310 surfaces
Error Code -111 reported for 1344 surfaces
Error Code -112 reported for 210 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

Slide Analysis Information

Section 4-4' Translational Analysis_2

Project Summary

File Name:	Section 4-4' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:02.973s
Project Title:	Section 4-4'
Analysis:	Offsite Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Bishop simplified
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Pile1 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	190000 lbs

Global Minimums

Method: bishop simplified

FS	1.006700
Axis Location:	440.542, 164.361
Left Slip Surface Endpoint:	353.802, 113.919
Right Slip Surface Endpoint:	428.852, 64.704
Resisting Moment:	4.32556e+06 lb-ft
Driving Moment:	4.29766e+06 lb-ft
Total Slice Area:	754.067 ft2
Surface Horizontal Width:	75.0499 ft
Surface Average Height:	10.0475 ft

Global Minimum Coordinates

Method: bishop simplified

415.28	67.0973
419.471	66.358
424.161	65.5308
428.852	64.7036

Global Minimum Support Data

Method: bishop simplified

Number of Supports: 1

Pile1 (Static)

Support Type: Pile/Micro Pile

Start (x, y)	Length (ft)	L Inside SS (ft)	L Outside SS (ft)	Li (ft)	Lo (ft)	Force (lb)
353.562, 114.069	101.374	Not Effective	Not Effective	Not Effective	Not Effective	0

Valid and Invalid Surfaces

Method: bishop simplified

Number of Valid Surfaces:	19757
Number of Invalid Surfaces:	5299

Error Codes

Error Code -106 reported for 38 surfaces
Error Code -108 reported for 31 surfaces
Error Code -110 reported for 502 surfaces
Error Code -111 reported for 245 surfaces
Error Code -112 reported for 297 surfaces
Error Code -121 reported for 688 surfaces
Error Code -124 reported for 2 surfaces
Error Code -145 reported for 45 surfaces
Error Code -1000 reported for 3451 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Slice Data

Global Minimum Query (bishop simplified) - Safety Factor: 1.0067

Section 4-4' Translational Analysis_2

Project Summary

File Name:	Section 4-4' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:02.827s
Project Title:	Section 4-4'
Analysis:	Offsite Slope (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Bishop simplified
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	200000 lbs

Global Minimums

Method: bishop simplified

FS	0.561902
Axis Location:	442.525, 165.841
Left Slip Surface Endpoint:	353.852, 113.886
Right Slip Surface Endpoint:	430.885, 63.730
Resisting Moment:	4.49741e+06 lb-ft
Driving Moment:	8.00391e+06 lb-ft
Total Slice Area:	899.301 ft2
Surface Horizontal Width:	77.0334 ft
Surface Average Height:	11.6742 ft

Global Minimum Coordinates

Method: bishop simplified

Valid and Invalid Surfaces

Method: bishop simplified

Number of Valid Surfaces:	16067
Number of Invalid Surfaces:	8989

Error Codes

Error Code -106 reported for 39 surfaces
Error Code -108 reported for 20 surfaces
Error Code -110 reported for 554 surfaces
Error Code -111 reported for 4343 surfaces
Error Code -112 reported for 277 surfaces
Error Code -121 reported for 832 surfaces
Error Code -124 reported for 2 surfaces
Error Code -145 reported for 20 surfaces
Error Code -1000 reported for 2902 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Slide Analysis Information

Section 4-4' Translational Analysis_2

Project Summary

File Name:	Section 4-4' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:04.929s
Project Title:	Section 4-4'
Analysis:	Offsite Slope Removal (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Bishop simplified
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	9.81
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	None
Ru Value	0

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Pile1 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	190000 lbs

Global Minimums

Method: bishop simplified

FS	2.140590
Axis Location:	397.633, 126.160
Left Slip Surface Endpoint:	353.849, 92.140
Right Slip Surface Endpoint:	398.579, 70.720
Resisting Moment:	1.54875e+06 lb-ft
Driving Moment:	723518 lb-ft
Total Slice Area:	295.304 ft2
Surface Horizontal Width:	44.7299 ft
Surface Average Height:	6.60193 ft

Global Minimum Coordinates

Valid and Invalid Surfaces

Method: bishop simplified

Number of Valid Surfaces:	16876
Number of Invalid Surfaces:	8193

Error Codes

Error Code -106 reported for 24 surfaces
Error Code -108 reported for 46 surfaces
Error Code -111 reported for 261 surfaces
Error Code -112 reported for 335 surfaces
Error Code -121 reported for 110 surfaces
Error Code -145 reported for 16 surfaces
Error Code -1000 reported for 7401 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Section 4-4' Translational Analysis_2

Project Summary

File Name:	Section 4-4' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:03.328s
Project Title:	Section 4-4'
Analysis:	Offsite Slope Removal (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Bishop simplified
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	200000 lbs

Number of Invalid Surfaces:	10473

Error Codes

Error Code -106 reported for 28 surfaces
Error Code -108 reported for 25 surfaces
Error Code -109 reported for 1 surface
Error Code -110 reported for 2839 surfaces
Error Code -111 reported for 227 surfaces
Error Code -112 reported for 167 surfaces
Error Code -121 reported for 159 surfaces
Error Code -145 reported for 18 surfaces
Error Code -1000 reported for 7009 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Slide Analysis Information

Section 4-4' Translational Analysis_2

Project Summary

File Name:	Section 4-4' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:28.226s
Project Title:	Section 4-4'
Analysis:	Upper Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Upper Slope Pile 1 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	105000 lbs

Upper Slope Pile 2 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	100000 lbs

Global Minimums

Method: spencer

FS	1.506350
Axis Location:	368.138, 140.858
Left Slip Surface Endpoint:	320.582, 123.111
Right Slip Surface Endpoint:	353.802, 92.165
Left Slope Intercept:	320.582 123.111
Right Slope Intercept:	353.802 113.919
Resisting Moment:	1.28414e+06 lb-ft
Driving Moment:	852486 lb-ft
Resisting Horizontal Force:	19896.4 lb
Driving Horizontal Force:	13208.3 lb
Active Support Moment:	-993911 lb-ft
Active Horizontal Support Force:	-15570.9 lb
Maximum Single Support Force:	10500 lb
Total Support Force:	20500 lb
Total Slice Area:	540.652 ft2
Surface Horizontal Width:	33.2204 ft
Surface Average Height:	16.2747 ft

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	16159
Number of Invalid Surfaces:	8900

Error Codes

Error Code -108 reported for 211 surfaces
Error Code -110 reported for 78 surfaces
Error Code -111 reported for 7512 surfaces
Error Code -112 reported for 75 surfaces
Error Code -113 reported for 1 surface
Error Code -121 reported for 702 surfaces
Error Code -124 reported for 1 surface
Error Code -145 reported for 5 surfaces
Error Code -1000 reported for 315 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-113 = Surface intersects outside slope limits.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Slice Data

Slide Analysis Information

Section 4-4' Translational Analysis_2

Project Summary

File Name:	Section 4-4' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:12.252s
Project Title:	Section 4-4'
Analysis:	Upper Slope (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Upper Slope Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	170000 lbs

Upper Slope Pile 2 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	273000 lbs

Global Minimums

Method: spencer

FS	1.008040
Axis Location:	335.088, 188.988
Left Slip Surface Endpoint:	268.858, 115.923
Right Slip Surface Endpoint:	353.802, 92.165
Left Slope Intercept:	268.858 115.923
Right Slope Intercept:	353.802 113.919
Resisting Moment:	6.52114e+06 lb-ft
Driving Moment:	6.46994e+06 lb-ft
Resisting Horizontal Force:	68506.1 lb
Driving Horizontal Force:	67968.2 lb
Active Support Moment:	-4.03429e+06 lb-ft
Active Horizontal Support Force:	-43406.9 lb
Maximum Single Support Force:	27300 lb
Total Support Force:	44300 lb
Total Slice Area:	1747.1 ft2
Surface Horizontal Width:	84.944 ft
Surface Average Height:	20.5677 ft

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	17244
Number of Invalid Surfaces:	7816

Error Codes

Error Code -108 reported for 150 surfaces
Error Code -110 reported for 405 surfaces
Error Code -111 reported for 5339 surfaces
Error Code -112 reported for 195 surfaces
Error Code -113 reported for 1 surface
Error Code -121 reported for 813 surfaces
Error Code -124 reported for 1 surface
Error Code -145 reported for 9 surfaces
Error Code -1000 reported for 903 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-113 = Surface intersects outside slope limits.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-124 = A slice has a width less than the minimum acceptable value.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Project Summary

File Name:	Section 4-4' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:10.827s
Project Title:	Section 4-4'
Analysis:	Entire Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5

Number of Invalid Surfaces: 6250

Error Codes

Error Code -108 reported for 130 surfaces
Error Code -110 reported for 1730 surfaces
Error Code -111 reported for 1813 surfaces
Error Code -112 reported for 225 surfaces
Error Code -113 reported for 1 surface
Error Code -121 reported for 654 surfaces
Error Code -124 reported for 1 surface
Error Code -145 reported for 22 surfaces
Error Code -1000 reported for 1674 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-113 = Surface intersects outside slope limits.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Slide Analysis Information

Section 4-4' Translational Analysis_2

Project Summary

File Name:	Section 4-4' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:15.113s
Project Title:	Section 4-4'
Analysis:	Entire Slope (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Loading

1 Distributed Load present

Distributed Load 1	
Distribution:	Constant
Magnitude [psf]:	300
Orientation:	Normal to boundary

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Entire Slope Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	545000 lbs

Entire Slope Pile 2 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	550000 lbs

Global Minimums

Method: spencer

FS	1.014560
Axis Location:	406.633, 356.269
Left Slip Surface Endpoint:	209.112, 115.923
Right Slip Surface Endpoint:	480.397, 54.045
Resisting Moment:	9.53246e+07 lb-ft
Driving Moment:	9.3957e+07 lb-ft
Resisting Horizontal Force:	310217 lb
Driving Horizontal Force:	305766 lb
Active Support Moment:	-3.21077e+07 lb-ft
Active Horizontal Support Force:	-105599 lb
Maximum Single Support Force:	55000 lb
Total Support Force:	109500 lb
Total Slice Area:	6128.85 ft2
Surface Horizontal Width:	271.285 ft
Surface Average Height:	22.592 ft

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	10744
Number of Invalid Surfaces:	14315

Error Codes

Error Code -108 reported for 50 surfaces
Error Code -110 reported for 2755 surfaces
Error Code -111 reported for 2551 surfaces
Error Code -112 reported for 186 surfaces
Error Code -113 reported for 1 surface
Error Code -121 reported for 1755 surfaces
Error Code -124 reported for 4 surfaces
Error Code -145 reported for 21 surfaces
Error Code -1000 reported for 6992 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-113 = Surface intersects outside slope limits.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Slice Data

Slide Analysis Information

Section 5-5' Translational Analysis_2

Project Summary

File Name:	Section 5-5' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:01.884s
Project Title:	Section 5-5'
Analysis:	Translational (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Pile 1 (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	125000 lbs

Global Minimums

Method: spencer

FS	1.502680
Axis Location:	353.084, 185.164
Left Slip Surface Endpoint:	255.860, 106.419
Right Slip Surface Endpoint:	357.746, 60.137
Resisting Moment:	7.49027e+06 lb-ft
Driving Moment:	4.98462e+06 lb-ft
Resisting Horizontal Force:	58806.9 lb
Driving Horizontal Force:	39134.8 lb
Active Support Moment:	-1.44124e+06 lb-ft
Active Horizontal Support Force:	-11405.7 lb
Maximum Single Support Force:	12500 lb
Total Support Force:	12500 lb
Total Slice Area:	1196.63 ft2
Surface Horizontal Width:	101.886 ft
Surface Average Height:	11.7448 ft

Global Minimum Coordinates

Method: spencer

X	Y
255.86	106.419
258.993	100.996
354.302	58.2568
357.746	60.1375

Global Minimum Support Data

Method: spencer

Number of Supports: 1

Pile 1 (Static)

Support Type: Pile/Micro Pile

Start (x, y)	Length (ft)	L Inside SS (ft)	L Outside SS (ft)	Li (ft)	Lo (ft)	Force (lb)

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	1033
Number of Invalid Surfaces:	3967

Error Codes

Error Code -105 reported for 167 surfaces
Error Code -108 reported for 28 surfaces
Error Code -110 reported for 3408 surfaces
Error Code -111 reported for 362 surfaces
Error Code -112 reported for 2 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

Slide Analysis Information

Section 5-5' Translational Analysis_2

Project Summary

File Name:	Section 5-5' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:00.506s
Project Title:	Section 5-5'
Analysis:	Translational (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	Water Table
Hu Value	1
Qlsr	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	200
Friction Angle [deg]	12
Water Surface	Water Table
Hu Value	1
Fill (Af)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	Water Table
Hu Value	1
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	535000 lbs

Global Minimums

Method: spencer

FS	0.999853
Axis Location:	302.220, 257.128
Left Slip Surface Endpoint:	177.319, 109.035
Right Slip Surface Endpoint:	345.754, 68.351
Resisting Moment:	2.25088e+07 lb-ft
Driving Moment:	2.25122e+07 lb-ft
Resisting Horizontal Force:	120864 lb
Driving Horizontal Force:	120882 lb
Active Support Moment:	-9.48764e+06 lb-ft
Active Horizontal Support Force:	-52512.7 lb
Maximum Single Support Force:	53500 lb
Total Support Force:	53500 lb
Total Slice Area:	2749.95 ft2
Surface Horizontal Width:	168.435 ft
Surface Average Height:	16.3265 ft

Global Minimum Coordinates

Method: spencer

X	Y
177.319	109.035
183.364	99.6099
345.349	68.0522
345.754	68.3509

Global Minimum Support Data

Method: spencer

Number of Supports: 1

Pile 1 (Seismic)

Support Type: Pile/Micro Pile

Start (x, y)	Length (ft)	L Inside SS (ft)	L Outside SS (ft)	Li (ft)	Lo (ft)	Force (lb)
304.345, 96.688	92.486	20.6474	71.8386	20.6474	71.8386	53500

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	762
Number of Invalid Surfaces:	4238

Error Codes

Error Code -105 reported for 170 surfaces
Error Code -108 reported for 15 surfaces
Error Code -110 reported for 3211 surfaces
Error Code -111 reported for 819 surfaces
Error Code -112 reported for 23 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

Slice Data

Global Minimum Query (spencer) - Safety Factor: 0.999853

Slide Analysis Information

Section 5-5' Translational Analysis_2

Project Summary

File Name:	Section 5-5' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:32.457s
Project Title:	Section 5-5'
Analysis:	Offsite Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	18408
Number of Invalid Surfaces:	6652

Error Codes

Error Code -106 reported for 52 surfaces
Error Code -108 reported for 77 surfaces
Error Code -109 reported for 1 surface
Error Code -110 reported for 172 surfaces
Error Code -111 reported for 4478 surfaces
Error Code -112 reported for 118 surfaces
Error Code -121 reported for 831 surfaces
Error Code -124 reported for 1 surface
Error Code -145 reported for 30 surfaces
Error Code -1000 reported for 892 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Slice Data

Slide Analysis Information

Section 5-5' Translational Analysis_2

Project Summary

File Name:	Section 5-5' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:45.49s
Project Title:	Section 5-5'
Analysis:	Offsite Slope (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100

Hu Value	1
Qlsr	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	200
Friction Angle [deg]	12
Water Surface	Water Table
Hu Value	1
Fill (Af)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	Water Table
Hu Value	1
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	535000 lbs

Global Minimums

Method: spencer

FS	0.670329
Axis Location:	356.925, 115.091
Left Slip Surface Endpoint:	312.629, 91.240
Right Slip Surface Endpoint:	349.427, 65.344
Resisting Moment:	587344 lb-ft
Driving Moment:	876203 lb-ft
Resisting Horizontal Force:	10250 lb
Driving Horizontal Force:	15291 lb
Total Slice Area:	192.885 ft2
Surface Horizontal Width:	36.7985 ft
Surface Average Height:	5.24164 ft

Global Minimum Coordinates

Method: spencer

X	Y
312.629	86.0711

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	13274
Number of Invalid Surfaces:	11785

Error Codes

Error Code -106 reported for 117 surfaces
Error Code -108 reported for 117 surfaces
Error Code -109 reported for 2 surfaces
Error Code -110 reported for 76 surfaces
Error Code -111 reported for 5545 surfaces
Error Code -112 reported for 3959 surfaces
Error Code -121 reported for 915 surfaces
Error Code -124 reported for 263 surfaces
Error Code -145 reported for 27 surfaces
Error Code -1000 reported for 764 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

SLIDEINTERPRET 9.018

Project	Section 5-5'				
Analysis Description	Offsite Slope Removal (Static)				
Drawn By	A. Greene	Scale	1:291	Company	Feffer Geological Consulting
Date				File Name	Section 5-5' Translational Analysis_2.slmd

Slide Analysis Information

Section 5-5' Translational Analysis_2

Project Summary

File Name:	Section 5-5' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:28.856s
Project Title:	Section 5-5'
Analysis:	Offsite Slope Removal (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	Water Table
Hu Value	1
Qlsr	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	200
Friction Angle [deg]	12
Water Surface	Water Table
Hu Value	1
Fill (Af)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	Water Table
Hu Value	1
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	535000 lbs

Global Minimums

Method: spencer

FS	3.225950
Axis Location:	336.909, 108.013
Left Slip Surface Endpoint:	304.391, 77.927
Right Slip Surface Endpoint:	341.467, 63.947
Resisting Moment:	958449 lb-ft
Driving Moment:	297106 lb-ft
Resisting Horizontal Force:	17609.4 lb
Driving Horizontal Force:	5458.69 lb
Total Slice Area:	187.508 ft2
Surface Horizontal Width:	37.0756 ft
Surface Average Height:	5.05746 ft

Global Minimum Coordinates

Method: spencer

X	Y
304.391	77.9272

341.467	63.9475

Global Minimum Support Data

Method: spencer

Number of Supports: 1

Pile 1 (Seismic)

Support Type: Pile/Micro Pile

Start (x, y)	Length (ft)	L Inside SS (ft)	L Outside SS (ft)	Li (ft)	Lo (ft)	Force (lb)
304.345, 96.688	92.486	Not Effective	Not Effective	Not Effective	Not Effective	0

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	15622
Number of Invalid Surfaces:	9450

Error Codes
Error Code -106 reported for 61 surfaces
Error Code -108 reported for 140 surfaces
Error Code -110 reported for 698 surfaces
Error Code -111 reported for 400 surfaces
Error Code -112 reported for 186 surfaces
Error Code -121 reported for 170 surfaces
Error Code -124 reported for 1 surface
Error Code -145 reported for 19 surfaces
Error Code -1000 reported for 7775 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Slice Data

Section 5-5' Translational Analysis_2

Project Summary

File Name:	Section 5-5' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:32.807s
Project Title:	Section 5-5'
Analysis:	Offsite Slope Removal (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31

Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile 1 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	535000 lbs

Global Minimums

Method: spencer

FS	1.606770
Axis Location:	353.008, 130.550
Left Slip Surface Endpoint:	304.400, 77.924
Right Slip Surface Endpoint:	365.944, 60.087
Resisting Moment:	2.1617e+06 lb-ft
Driving Moment:	1.34537e+06 lb-ft
Resisting Horizontal Force:	26983.3 lb
Driving Horizontal Force:	16793.5 lb
Total Slice Area:	282.232 ft2
Surface Horizontal Width:	61.5442 ft
Surface Average Height:	4.58585 ft

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	14883
Number of Invalid Surfaces:	10196

Error Codes

Error Code -106 reported for 63 surfaces
Error Code -108 reported for 94 surfaces
Error Code -109 reported for 2 surfaces
Error Code -110 reported for 1478 surfaces
Error Code -111 reported for 812 surfaces
Error Code -112 reported for 104 surfaces
Error Code -121 reported for 477 surfaces
Error Code -145 reported for 20 surfaces
Error Code -1000 reported for 7146 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Section 5-5' Translational Analysis_2

Project Summary

File Name:	Section 5-5' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:10.360s
Project Title:	Section 5-5'
Analysis:	Upper Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Error Codes

Error Code -106 reported for 13 surfaces
Error Code -108 reported for 363 surfaces
Error Code -109 reported for 1 surface
Error Code -110 reported for 444 surfaces
Error Code -111 reported for 4213 surfaces
Error Code -112 reported for 178 surfaces
Error Code -121 reported for 83 surfaces
Error Code -124 reported for 2 surfaces
Error Code -145 reported for 34 surfaces
Error Code -1000 reported for 483 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Section 5-5' Translational Analysis_2

Project Summary

File Name:	Section 5-5' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:08.911s
Project Title:	Section 5-5'
Analysis:	Upper Slope (Seismic)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100

Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	Water Table
Hu Value	1
Anisotropic Bedrock (Tm) Peak	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	230000 lbs

Pile 2 (Seismic)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	230000 lbs

Global Minimums

Method: spencer

FS	1.009250
Axis Location:	270.936, 224.826
Left Slip Surface Endpoint:	173.479, 109.972
Right Slip Surface Endpoint:	304.345, 77.948
Left Slope Intercept:	173.479 109.972
Right Slope Intercept:	304.345 105.922
Resisting Moment:	1.35434e+07 lb-ft
Driving Moment:	1.34193e+07 lb-ft
Resisting Horizontal Force:	95319.1 lb
Driving Horizontal Force:	94445.8 lb
Active Support Moment:	-6.38633e+06 lb-ft
Active Horizontal Support Force:	-45299.4 lb
Maximum Single Support Force:	23000 lb
Total Support Force:	46000 lb
Total Slice Area:	2203.86 ft2
Surface Horizontal Width:	130.866 ft
Surface Average Height:	16.8405 ft

Global Minimum Coordinates

Number of Invalid Surfaces:	11076

Error Codes

Error Code -106 reported for 32 surfaces
Error Code -108 reported for 126 surfaces
Error Code -109 reported for 3 surfaces
Error Code -110 reported for 5331 surfaces
Error Code -111 reported for 3097 surfaces
Error Code -112 reported for 326 surfaces
Error Code -121 reported for 311 surfaces
Error Code -124 reported for 50 surfaces
Error Code -145 reported for 17 surfaces
Error Code -1000 reported for 1783 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Slice Data

Project Summary

File Name:	Section 5-5' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:13.203s
Project Title:	Section 5-5'
Analysis:	Upper Slope (Static) 1
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Terrace (Qoa)

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Pile (Static)1	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	300180 lbs

Global Minimums

Method: spencer

FS	1.514210
Axis Location:	342.223, 208.337
Left Slip Surface Endpoint:	233.071, 106.873
Right Slip Surface Endpoint:	357.903, 60.137
Resisting Moment:	1.36693e+07 lb-ft
Driving Moment:	9.03279e+06 lb-ft
Resisting Horizontal Force:	85781 lb
Driving Horizontal Force:	56684.8 lb
Active Support Moment:	-4.28627e+06 lb-ft
Active Horizontal Support Force:	-26002.6 lb
Maximum Single Support Force:	30018 lb
Total Support Force:	30018 lb
Total Slice Area:	1820.2 ft2
Surface Horizontal Width:	124.832 ft
Surface Average Height:	14.5812 ft

Number of Valid Surfaces:	17188
Number of Invalid Surfaces:	7871

Error Codes

Error Code -106 reported for 19 surfaces
Error Code -108 reported for 228 surfaces
Error Code -109 reported for 1 surface
Error Code -110 reported for 4209 surfaces
Error Code -111 reported for 1408 surfaces
Error Code -112 reported for 182 surfaces
Error Code -121 reported for 824 surfaces
Error Code -145 reported for 20 surfaces
Error Code -1000 reported for 980 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.
-121 = Concave failure surface, only convex surfaces have been defined as being allowed.
-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.
-1000 = No valid slip surface is generated

Section 5-5' Translational Analysis_2

Project Summary

File Name:	Section 5-5' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:18.525s
Project Title:	Section 5-5'
Analysis:	Upper Slope (Seismic) 1
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Search Method:	Cuckoo Search
Initial # of Surface Vertices:	8
Maximum Iterations:	500
Number of Nests:	50
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined
Convex Surfaces Only:	Enabled

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No
Seismic Load Coefficient (Horizontal):	0.35

Materials

Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Peak

Angle From	Angle To	c	phi
-90	-30	720	41
-30	-10	200	16
-10	90	720	41

Support

Pile (Seismic)1	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	400000 lbs

Pile (Seismic) 2	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	400000 lbs

Global Minimums

Method: spencer

FS	1.004880
Axis Location:	314.869, 269.934
Left Slip Surface Endpoint:	172.479, 110.288
Right Slip Surface Endpoint:	357.152, 60.234
Resisting Moment:	2.94248e+07 lb-ft
Driving Moment:	2.92818e+07 lb-ft
Resisting Horizontal Force:	142822 lb
Driving Horizontal Force:	142128 lb
Active Support Moment:	-1.59257e+07 lb-ft
Active Horizontal Support Force:	-78762.3 lb
Maximum Single Support Force:	40000 lb
Total Support Force:	80000 lb
Total Slice Area:	3379.54 ft2
Surface Horizontal Width:	184.673 ft
Surface Average Height:	18.3001 ft

Number of Valid Surfaces: 11339
Number of Invalid Surfaces: 13726

Error Codes

Error Code -106 reported for 28 surfaces
Error Code -108 reported for 110 surfaces
Error Code -109 reported for 5 surfaces
Error Code -110 reported for 5235 surfaces
Error Code -111 reported for 2388 surfaces
Error Code -112 reported for 155 surfaces
Error Code -121 reported for 2199 surfaces
Error Code -124 reported for 115 surfaces
Error Code -145 reported for 35 surfaces
Error Code -1000 reported for 3456 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-106 = Average slice width is less than 0.0001 * (maximum horizontal extent of soil region). This limitation is imposed to avoid numerical errors which may result from too many slices, or too small a slip region.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-109 = Soiltype for slice base not located. This error should occur very rarely, if at all. It may occur if a very low number of slices is combined with certain soil geometries, such that the midpoint of a slice base is actually outside the soil region,even though the slip surface is wholly within the soil region.

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

-111 = Safety factor equation did not converge

-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

-121 = Concave failure surface, only convex surfaces have been defined as being allowed.

-124 = A slice has a width less than the minimum acceptable value.

-145 = Slip surface was clipped vertically by a weak layer in a region of compression. Such a surface cannot be evaluated using Limit Equilibrium. For more information, see Help Documentation on weak layers.

-1000 = No valid slip surface is generated

Slice Data

Slide Analysis Information

Section 6-6' Translational Analysis_2

Project Summary

File Name:	Section 6-6' Translational Analysis_2.slmd
Slide Modeler Version:	9.018
Compute Time:	00h:00m:00.653s
Project Title:	Section 6-6'
Analysis:	Translational (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Spencer
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Qlsa	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	200
Friction Angle [deg]	16
Water Surface	None
Ru Value	0
Fill (Af)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm)	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	None
Ru Value	0

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Support

Pile (Static)	
Color	
Type	Pile/Micro Pile
Force Application	Active (Method A)
Force Orientation	Parallel to surface
Out-Of-Plane Spacing	10 ft
Failure Mode	Shear
Pile Shear Strength	10000 lbs

Global Minimums

Method: spencer

FS	1.233810
Axis Location:	429.215, 302.103
Left Slip Surface Endpoint:	248.536, 136.912
Right Slip Surface Endpoint:	452.961, 58.446
Resisting Moment:	4.8391e+07 lb-ft
Driving Moment:	3.92208e+07 lb-ft
Resisting Horizontal Force:	190111 lb
Driving Horizontal Force:	154085 lb
Total Slice Area:	4090.15 ft2
Surface Horizontal Width:	204.425 ft
Surface Average Height:	20.0081 ft

Global Minimum Coordinates

Method: spencer

X	Y
248.536	136.912
262.73	118.947
437.915	49.437
452.961	58.4459

Global Minimum Support Data

Method: spencer

Number of Supports: 1

Pile (Static)

Support Type: Pile/Micro Pile

Start (x, y)	Length (ft)	L Inside SS (ft)	L Outside SS (ft)	Li (ft)	Lo (ft)	Force (lb)
115.177, 135.357	60	Not Effective	Not Effective	Not Effective	Not Effective	0

Valid and Invalid Surfaces

Method: spencer

Number of Valid Surfaces:	4484
Number of Invalid Surfaces:	516

Error Codes

Error Code -105 reported for 4 surfaces
Error Code -108 reported for 52 surfaces
Error Code -111 reported for 459 surfaces
Error Code -112 reported for 1 surface

Error Code Descriptions

The following errors were encountered during the computation:
-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = Safety factor equation did not converge
-112 = The coefficient M-Alpha = cos(alpha)(1+tan(alpha)tan(phi)/F) < 0.2 for the final iteration of the safety factor calculation. This screens out some slip surfaces which may not be valid in the context of the analysis, in particular, deep seated slip surfaces with many high negative base angle slices in the passive zone.

Slice Data

Global Minimum Query (spencer) - Safety Factor: 1.23381

Preliminary Stability Analysis

Letter

FEFFER
GEOLOGICAL CONSULTING

March 25, 2021 File No: 1992-75

City of Malibu
23285 Stuart Ranch Road
Malibu, CA 90265
Attn: Chris Dean & Ali Abdel-Haq

Subject: **PRELIMINARY SLOPE STABILITY ANALYSIS**
25200-25300 Pacific Coast Highway, Malibu, CA 90265
APN: 4459-013-021, 4459-014-018

Dear Mr. Dean and Mr. Abdel-Haq:

Feffer Geological Consulting has prepared this letter based on previous correspondence to provide a preliminary review of laboratory results and translational slope stability analysis for the referenced project. The primary purpose of this letter is to specifically address the selection of ultimate, peak, and residual bedrock shear values for use in additional translational slope stability analyses that have been requested as part of item 4 in the current geotechnical review sheet dated August 4, 2020 (Log Number 4165). The goal is to provide substantial evidence and reasoning for the selection of bedrock shear values based on laboratory testing conducted on additional bedrock samples and research, and to mutually agree on the selected values for use in the requested analysis.

If you have any questions, please feel free to call our office.

Respectfully submitted,

Joshua R. Feffer
Principal Engineering Geologist
C.E.G. 2138

BACKGROUND

This firm previously provided slope stability analyses in the reports dated 5/21/2018, 9/20/2018, 12/17/2019, and 6/18/2020 to assess the gross static and seismic stability per the City of Malibu Geotechnical Guidelines. Previous analyses utilized an ultimate bedrock shear strength of Phi = 23.5°, Cohesion = 640 psf and produced static factors of safety less than 1.0. Since the static factors of safety were less than 1.0, we noted that the selected shear values in the analyses were overly conservative in response to item #16 of the 9/20/2018 response letter.

Currently, the existing slope has not failed, meaning the site has at a minimum a static factor of safety greater than 1.0. Our basic assumption is that the resisting forces are currently greater than the driving forces resulting in a slope that is currently not failing. Therefore, we start with this basic assumption to help with the selection of bedrock shear values in additional analyses.

METHOD

An iterative process of elimination was implemented to select varying combinations of ultimate, peak, and residual bedrock values using an anisotropic function for potentially adverse bedding planes. This enabled us to derive a combination of values we believe are reasonable for use in analysis, but still conservative for the underlying bedrock. The basis for selecting the values discussed below is guided by our initial assumption that the slope should achieve at least a static factor of safety greater than 1.0.

LABORATORY TESTING

Laboratory testing was performed on selected bedrock samples at Soil Labworks, LLC. Bedrock samples were tested at varying depths ranging from 20 to 45 feet below the ground surface. Three samples were tested for ultimate and peak strength, and four samples were repeatedly sheared to determine residual strength. We have reviewed the tested values and agree with the provided results. A table summarizing the results is provided below, and the testing is attached at the back of this letter for review.

Material	Depth (ft.)	Phi Angle (°)	Cohesion (psf)	Type
Bedrock	30	32	580	Ultimate
		32	780	Peak
	40	40	160	Ultimate
		38	520	Peak
	45	34.5	520	Ultimate
		41	720	Peak
	20	35.5	500	Residual
	20	33.5	300	Residual
	30	34	720	Residual
	30	29	600	Residual

Based on the method used and testing summarized above we selected the highlighted values for use in subsequent stability analyses. The ultimate value shall be used to model static conditions, and the peak value shall be used to model seismic conditions that apply a 0.35g horizontal acceleration.

To provide a conservative analysis, we decided not to use any of the recently tested residual shear strength values shown above. Although we believe these values are reasonable, we have decided instead to adopt the back calculated slide plane value prepared by Leighton (1979) of phi = 16° and C = 200 psf. It should be noted that Leighton (1979) prepared this back calculated value for analysis since their tested value produced calculated static factors of safety less than 1.0. Leighton (1979) stated that their tested residual value was not representative of the underlying bedrock conditions.

To corroborate this back calculation, we are also providing a residual shear strength test obtained by GeoConcepts, Inc. (2006) and approved by the City (2006) of phi = 16° and C = 250psf for a bentonite lens found at a depth of 27.5 ft. for the site located at 25447 Malibu Road. This site is underlain by similar geologic conditions and located immediately west of the project site. However, no bentonite lenses were identified on the project site.

Furthermore, to model potential adverse bedding planes an anisotropic function shall be adopted for south dipping bedding planes ranging from 10 to 30 degrees and the selected residual value will be applied to this range of bedding planes for translational analysis.

PRELIMINARY STATIC ANALYSES

Using the selected values discussed above based on the iterative method of selection, we prepared a static translational analysis utilizing the Janbu Simplified method to determine if the selected values produce a static factor of safety that is slightly greater than 1.0. The results are summarized in the table below.

Cross Section	Static F.S.
Section 2-2’	1.186
Section 3-3’	1.136
Section 4-4’	1.234
Section 5-5’	1.076
Section 6-6’	1.094

CONCLUSION

It is our opinion that the selected and adopted values are reasonable for use in the additional translational analyses. This conclusion is based on and supported by 1) additional laboratory testing of select bedrock samples at varying depths, 2) back calculation of residual shear strength for adverse bedding supported by lab testing from a nearby site with similar geology, and 3) preliminary static analyses of translational stability achieving factors of safety slightly greater than 1.0 which verify that the selected values are at least in part reflective of actual site conditions.

Laboratory testing for the subject property was performed by Soil Labworks, LLC., under the supervision of the undersigned Engineer. Previous work is presented in the referenced report. Samples of the earth materials were obtained from the subject property by personnel of Feffer Geological and transported to the laboratory of Soil Labworks for testing and analysis. The laboratory tests performed are described and results are attached.

Services performed by this facility for the subject property were conducted in a manner consistent with that level of care and skill ordinarily exercised by members of the profession currently practicing in the same locality under similar conditions.

APPENDIX

Laboratory Testing

Sample Retrieval - Drill Rig

Samples of earth materials were obtained at frequent intervals by driving a thick-walled steel sampler conforming to the most recent version of ASTM D 3550/D 3550M-17 with successive drops of a 140 pound hammer falling 30". The earth material was retained in brass rings of 2.416 inches inside diameter and 1.00 inch height. The central portion of the sample was stored in close-fitting, water-tight containers for transportation to the laboratory. Standard Penetration Tests (SPT) were performed at discrete intervals within the 8 inch

Moisture Density

The field moisture content and dry density were determined for each of the soil samples. The dry density was determined in pounds per cubic foot following ASTM 2937-17e2. The moisture content was determined as a percentage of the dry soil weight conforming to ASTM 2216-19. The results are presented below in the following table. The percent saturation was calculated on the basis of an estimated specific gravity. Description of earth materials used in this report and shown on the attached Plates were provided by the client.

Test Pit/Boring No.	Sample Depth (Feet)	Soil Type	Dry Density (pcf)	Moisture Content (percent)	Percent Saturation (G_s=2.65)
B10	10	Bedrock	79.7	29	71
B10	21	Bedrock	83.5	26.6	72
B10	30	Bedrock	82.7	28.7	76
B10	40	Bedrock	83.4	28.1	76
B10	50	Bedrock	88.9	28.2	87
B10	60	Bedrock	83.4	28.0	75
B10	70	Bedrock	82.5	28.6	76
B10	79.5	Bedrock	78.1	34.2	81
B11	10	Bedrock	70.3	43.6	85
B11	20	Bedrock	87.1	27.2	80
B11	30	Bedrock	83.5	26.2	71
B11	45	Bedrock	91.4	25.3	83
B12	10	Bedrock	104.2	13.6	61
B12	20	Bedrock	102.3	20.8	89
B12	30	Bedrock	107.6	5.4	27
B12	40	Bedrock	89.3	22.4	70

Shear Strength

The peak and ultimate shear strengths of the bedrock were determined by performing consolidated and drained direct shear tests in conformance with ASTM D3080/D3080M-11. The tests were performed in a strain-controlled machine manufactured by GeoMatic. The rate of deformation was 0.005 inches per minute. Samples were sheared under varying confining pressures, as shown on the "Shear Test Diagrams," B-Plates. The residual shear strength of the bedrock was determined by repeatedly shearing a sample under varying confining pressures in the direct shear machine. The rate of deformation for the last test at each confining pressure was 0.005 inches per minute. The moisture conditions during testing are shown on the following table and on the B-Plates. The samples indicated as saturated were artificially saturated in the laboratory. All saturated samples were sheared under submerged conditions.

Test Pit/ Boring No.	Sample Depth (Feet)	Dry Density (pcf)	As-Tested Moisture Content (percent)
B10	30	82.7	45.8
B10	40	83.4	44.3
B11	45	91.4	38.8
B11*	20	87.1	36.5
B12*	20	102.3	33.3
B11*	30	83.5	37.7
B12*	30	107.6	42.4

* Sample repeatedly sheared to determine residual strength.

Project Summary

File Name:	Section 2-2' Translational Analysis 1.slmd
Slide Modeler Version:	9.013
Compute Time:	00h:00m:00.363s
Project Title:	Section 2-2'
Analysis:	Existing Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting
Comments	
	Translational

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Janbu simplified
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

497.63	65.972

Global Minimum Support Data

No Supports Present

Valid and Invalid Surfaces

Method: janbu simplified

Number of Valid Surfaces:	989
Number of Invalid Surfaces:	4011

Error Codes
Error Code -105 reported for 682 surfaces
Error Code -110 reported for 3329 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-105 = More than two surface / slope intersections with no valid slip surface.

-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.

Slide Analysis Information

Section 3-3' Translational Analysis 1

Project Summary

File Name:	Section 3-3' Translational Analysis 1.slmd
Slide Modeler Version:	9.013
Compute Time:	00h:00m:00.391s
Project Title:	Section 3-3'
Analysis:	Existing Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting
Comments	
	Translational

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Janbu simplified
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	None
Ru Value	0

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Global Minimums

Method: janbu simplified

FS	1.135900
Axis Location:	497.778, 216.562
Left Slip Surface Endpoint:	373.522, 131.205
Right Slip Surface Endpoint:	491.510, 65.943
Resisting Horizontal Force:	51512 lb
Driving Horizontal Force:	45349.2 lb
Total Slice Area:	884.143 ft2
Surface Horizontal Width:	117.988 ft
Surface Average Height:	7.49349 ft

Global Minimum Coordinates

Method: janbu simplified

X	Y
373.522	131.205
385.771	118.406
487.074	63.2092
491.51	65.9426

Global Minimum Support Data

No Supports Present

Valid and Invalid Surfaces

Method: janbu simplified

Number of Valid Surfaces:	4279
Number of Invalid Surfaces:	721

Error Codes

Error Code -105 reported for 717 surfaces
Error Code -108 reported for 3 surfaces
Error Code -111 reported for 1 surface

Error Code Descriptions

The following errors were encountered during the computation:
-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = Safety factor equation did not converge

Slice Data

Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	Water Table
Hu Value	1

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Global Minimums

Method: janbu simplified

FS	1.233960
Axis Location:	442.776, 222.406
Left Slip Surface Endpoint:	316.716, 123.111
Right Slip Surface Endpoint:	446.576, 61.981
Resisting Horizontal Force:	118647 lb
Driving Horizontal Force:	96151.2 lb
Total Slice Area:	2298.66 ft2
Surface Horizontal Width:	129.86 ft
Surface Average Height:	17.7011 ft

Global Minimum Coordinates

Method: janbu simplified

X	Y
316.716	123.111
326.445	102.638
431.363	50.1098
446.576	61.9807

Global Minimum Support Data

No Supports Present

Valid and Invalid Surfaces

Method: janbu simplified

Number of Valid Surfaces:	2496
Number of Invalid Surfaces:	2504

Error Codes

Error Code -105 reported for 182 surfaces
Error Code -110 reported for 2312 surfaces
Error Code -111 reported for 10 surfaces

Error Code Descriptions

The following errors were encountered during the computation:
-105 = More than two surface / slope intersections with no valid slip surface.
-110 = The water table or a piezoline does not span the slip region for a given slip surface, when Water Surfaces is specified as the method of pore pressure calculation. If this error occurs, check that the water table or piezoline(s) span the appropriate soil cells.
-111 = Safety factor equation did not converge

Slice Data

Global Minimum Query (janbu simplified) - Safety Factor: 1.23396

Slide Analysis Information

Section 5-5' Translational Analysis 1

Project Summary

File Name:	Section 5-5' Translational Analysis 1.slmd
Slide Modeler Version:	9.013
Compute Time:	00h:00m:00.447s
Project Title:	Section 5-5'
Analysis:	Existing Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting
Comments	
	Translational

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Janbu simplified
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Qlsr	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	200
Friction Angle [deg]	12
Water Surface	None
Ru Value	0
Fill (Af)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm) Ultimate	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	None
Ru Value	0

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Global Minimums

Method: janbu simplified

FS	1.076230
Axis Location:	351.621, 186.625
Left Slip Surface Endpoint:	253.812, 106.459
Right Slip Surface Endpoint:	357.068, 60.278
Resisting Horizontal Force:	63501 lb
Driving Horizontal Force:	59003.3 lb
Total Slice Area:	1283.25 ft2
Surface Horizontal Width:	103.257 ft
Surface Average Height:	12.4277 ft

Global Minimum Coordinates

Method: janbu simplified

X	Y
253.812	106.459
256.287	103.921
350.193	56.7865
357.068	60.278

Global Minimum Support Data

No Supports Present

Valid and Invalid Surfaces

Method: janbu simplified

Number of Valid Surfaces:	4738
Number of Invalid Surfaces:	262

Error Codes
Error Code -105 reported for 248 surfaces
Error Code -108 reported for 8 surfaces
Error Code -111 reported for 6 surfaces

Error Code Descriptions

The following errors were encountered during the computation:

-105 = More than two surface / slope intersections with no valid slip surface.

-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).

-111 = Safety factor equation did not converge

Slice Data

Global Minimum Query (janbu simplified) - Safety Factor: 1.07623

Project	Section 6-6'				
Analysis Description	Existing Slope (Static)				
Drawn By	A. Greene	Scale	1:621	Company	Feffer Geological Consulting
Date				File Name	Section 6-6' Translational Analysis.slmd

Slide Analysis Information

Section 6-6' Translational Analysis

Project Summary

File Name:	Section 6-6' Translational Analysis.slmd
Slide Modeler Version:	9.013
Compute Time:	00h:00m:00.483s
Project Title:	Section 6-6'
Analysis:	Existing Slope (Static)
Author:	A. Greene
Company:	Feffer Geological Consulting
Comments	
	Translational

General Settings

Units of Measurement:	Imperial Units
Time Units:	days
Permeability Units:	feet/second
Data Output:	Standard
Failure Direction:	Left to Right

Analysis Options

Slices Type:	Vertical
Analysis Methods Used	
	Janbu simplified
Number of slices:	50
Tolerance:	0.005
Maximum number of iterations:	75
Check malpha < 0.2:	Yes
Create Interslice boundaries at intersections with water tables and piezos:	Yes
Initial trial value of FS:	1
Steffensen Iteration:	Yes

Groundwater Analysis

Groundwater Method:	Water Surfaces
Pore Fluid Unit Weight [lbs/ft3]:	62.4
Use negative pore pressure cutoff:	Yes
Maximum negative pore pressure [psf]:	0
Advanced Groundwater Method:	None

Random Numbers

Pseudo-random Seed:	10116
Random Number Generation Method:	Park and Miller v.3

Surface Options

Surface Type:	Non-Circular Block Search
Number of Surfaces:	5000
Multiple Groups:	Disabled
Pseudo-Random Surfaces:	Enabled
Convex Surfaces Only:	Disabled
Left Projection Angle (Start Angle) [deg]:	115
Left Projection Angle (End Angle) [deg]:	135
Right Projection Angle (Start Angle) [deg]:	45
Right Projection Angle (End Angle) [deg]:	25
Minimum Elevation:	Not Defined
Minimum Depth:	Not Defined
Minimum Area:	Not Defined
Minimum Weight:	Not Defined

Seismic Loading

Advanced seismic analysis:	No
Staged pseudostatic analysis:	No

Materials

Terrace (Qoa)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	100
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Qlsa	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	115
Cohesion [psf]	200
Friction Angle [deg]	16
Water Surface	None
Ru Value	0
Fill (Af)	
Color	
Strength Type	Mohr-Coulomb
Unit Weight [lbs/ft3]	120
Cohesion [psf]	120
Friction Angle [deg]	31
Water Surface	None
Ru Value	0
Anisotropic Bedrock (Tm)	
Color	
Strength Type	Anisotropic function
Unit Weight [lbs/ft3]	124
Water Surface	None
Ru Value	0

Anisotropic Functions

Name: Anisotropic Bedrock (Tm) Ultimate

Angle From	Angle To	c	phi
-90	-30	520	34.5
-30	-10	200	16
-10	90	520	34.5

Global Minimums

Method: janbu simplified

FS	1.093900
Axis Location:	433.388, 294.483
Left Slip Surface Endpoint:	256.348, 136.912
Right Slip Surface Endpoint:	453.220, 58.308
Resisting Horizontal Force:	168797 lb
Driving Horizontal Force:	154308 lb
Total Slice Area:	4024.8 ft2
Surface Horizontal Width:	196.873 ft
Surface Average Height:	20.4436 ft

Global Minimum Coordinates

Method: janbu simplified

X	Y
256.348	136.912
258.499	133.185
423.003	43.7694
453.22	58.3078

Global Minimum Support Data

No Supports Present

Valid and Invalid Surfaces

Method: janbu simplified

Number of Valid Surfaces:	4995
Number of Invalid Surfaces:	5

Error Codes
Error Code -105 reported for 1 surface
Error Code -108 reported for 3 surfaces
Error Code -111 reported for 1 surface

Error Code Descriptions

The following errors were encountered during the computation:
-105 = More than two surface / slope intersections with no valid slip surface.
-108 = Total driving moment or total driving force < 0.1. This is to limit the calculation of extremely high safety factors if the driving force is very small (0.1 is an arbitrary number).
-111 = Safety factor equation did not converge

Slice Data

Global Minimum Query (janbu simplified) - Safety Factor: 1.0939

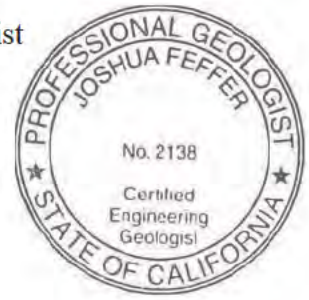
By: City of Malibu, Dated January 30, 2020
Response By: Feffer Geological, Dated June 18, 2020

Dear Mr. Weintraub:

As requested, Feffer Geological Consultants is providing this supporting geology report to accompany the "*Infiltration Test Report For A Subsurface Drip Disposal System*" provided by EPD Consultants.



We appreciate the opportunity to be of service. Should you have any questions regarding the information contained in this report, please do not hesitate to contact us.

Sincerely,

FEFFER GEOLOGICAL CONSULTING, INC.

Joshua R. Feffer
Principal Engineering Geologist
C.E.G. 2138

Distribution: Addressee– (1)

INTRODUCTION

It is our understanding that a low-impact intermittently dosed Subsurface Wastewater Infiltration System (SWIS) is considered for use to protect surface water and ground water by limiting discharge into the underlying material and disposing of the wastewater to the atmosphere through evapotranspiration.

EPD Consultants was retained to test subsurface infiltration rates and provide recommendations for an intermittently dosed Subsurface Wastewater Infiltration System (SWIS). This report is provided to characterize the site geology utilizing United States Department of Agriculture (USDA) terminology and the soil texture triangle within the areas designated and tested by EPD Consultants.

SITE GEOLOGY

EPD Consultants tested the subsurface conditions by excavating eight hand-dug infiltration test pits on the subject property (ITP-1 through ITP-8) to a maximum depth of 6 feet below the existing ground surface. Each test pit was described and logged in detail by one of our field geologists on April 14, 2020. Bulk soil samples were collected and tested in the laboratory to accurately describe the encountered soils according to USDA terminology. Excavation logs and laboratory testing of select samples are provided in Appendix A.

The "Infiltration Test Plan" prepared by EPD is included which illustrates test pit locations (Appendix A). A brief description of the geologic materials encountered is included below.

Artificial Fill (Af)

The site is overlain by less than 1 foot of fill. The fill primarily consists of reworked alluvium and bedrock and was encountered in five of the eight infiltration test pits (ITP-1, 2, 4, 5, and 7). The fill typically consists of fine to medium grained silty sand with scattered gravels and bedrock fragments. The fill is poorly sorted, massive, slightly moist to dry.

Quaternary Older Alluvium (Qoa)

The older alluvium is part of wave cut terrace deposits that locally cap the bedrock on site. Older alluvium was encountered in five of the eight infiltration test pits (ITP-3, 5, 6, 7 and 8). The alluvium typically consists of fine to medium grained clayey sand and silty sand containing few fine scattered gravels. It was observed to be poorly sorted, massive to blocky, slightly moist, and brown to reddish brown in color.

Monterey Formation Bedrock (Tm)

Monterey formation is found at varying depths along the entire project site but is generally near the surface and crops out along the northern portion of the site. Weathered Monterey formation bedrock was encountered in six of the eight infiltration test pits (ITP-1, 2, 3, 4, 6, and 8). The weathered bedrock typically consists of fine-grained interbedded siltstone, sandstone, and claystone that is very weak to very hard. The bedrock was observed as moderately to very weathered and massive to bedded and platy with scattered gypsum infilled fractures. The color ranges from reddish brown to yellowish brown and is typically slightly moist to dry.

Groundwater

No groundwater was encountered within the infiltration test pits to the depth's explored. Based on previous work conducted by this firm, groundwater is anticipated to fluctuate between 40 to 50 feet below the existing ground surface. The annual average and seasonal high groundwaters levels are therefore estimated to be significantly deeper than the proposed SWIS depths. It is our opinion that the use of the proposed SWIS will have no impact on groundwater levels.

Slope Stability

The proposed SWIS will be designed such that effluent will be intermittently dosed over an entire 24-hour period to prevent hydraulic overloading. Given the low rates of infiltration (0.39 gallons per square foot per day) and the large dispersal area (5,100 square feet), no significant amount of effluent will permeate the subsurface. As such, it is our opinion that the use of the proposed SWIS will have no impact on the overall gross site stability.

USDA Classification

The following table identifies the observed soils based on the USDA soil classification from four representative test pits within the designated testing area. Results have been plotted on the USDA texture triangle based on the percent sand, clay, and silt derived from the laboratory testing (Appendix A).

USDA Soil Texture				
Test Pit	**Sand (%)**	**Clay (%)**	**Silt (%)**	**USDA Texture**
ITP-1	36.0	25.0	39.0	Loam
ITP-2	66.1	10.2	23.7	Sandy Loam
ITP-8	34.2	31.1	34.7	Clay Loam
ITP-5	50.8	16.3	32.9	Loam

CONCLUSIONS AND RECOMMENDATIONS

It is our opinion that the use of a SWIS will have very little to no impact on groundwater levels and gross site stability. The final OWTS design shall not exceed daily dosing rates recommended by EPD Consultants.

We do not recommend that effluent be directly infiltrated into the underlying bedrock below a depth of 10 feet from the existing ground surface to preserve site stability and natural groundwater levels. Should there be a change in the system design which would result in the excessive discharge of water into the underlying materials, updated design plans shall be sent to this office to evaluate the effects effluent may have on groundwater levels and site stability.

Additionally, should irrigation be considered for landscape maintenance, an irrigation/watering plan and system should be prepared, designed, and implemented accordingly by the appropriate consultant. Surface irrigation rates should not exceed daily infiltrations rates recommended by EPD Consultants, OR the acceptable rates determined by the appropriate consultant to prevent excessive infiltration into the underlying material. The irrigation system should be designed to incorporate an emergency shut-off to prevent excessive watering in the event of a system failure. The final system should be monitored annually for leaks, breaks, cracks, or other conditions which might inadvertently discharge water at a greater rate than prescribed. If a system malfunction is detected corrective actions should be taken immediately by the owner as determined by the appropriate consultant.

Scale: 1"=50'

GRAPHIC SCALE: 1"=50'

NOTES:

1. THIS PLAN IS ACCURATE FOR INFILTRATION TESTING ONLY. GEOLOGIC MAP PROVIDED BY FEFFER GEOLOGICAL CONSULTING, DATED DECEMBER 17, 2019.
2. THE PROJECT GEOLOGIST SHALL LOG ALL TEST PITS AND PROVIDE SOIL TEXTURE & STRUCTURE DATA, PER USDA.
3. SUBSURFACE DRIP DISPERSAL FIELD (DISPOSAL FIELD) SHALL BE SITUATED SUCH THAT THE PERIMETER OF THE FULLY DEVELOPED DISPOSAL FIELD IS A MINIMUM OF:
   A. 5–FT FROM PROPERTY LINE ABUTTING PRIVATE PROPERTY;
   B. 8–FT FROM BUILDINGS OR STRUCTURES;
   C. 100–FT FROM THE EDGE OF ANY BODY OF WATER;
   D. 100–FT FROM ANY WATER SUPPLY WELL (UNLESS WELL IS TO BE ABANDONED PER UPC);
   E. 5–FT FROM THE EDGE OF SEEPAGE PITS;
   F. 5–FT FROM SEPTIC TANK & 4–FT (MIN) FROM OTHER DISPOSAL FIELDS;
   G. 10–FT FROM PRESSURE PUBLIC WATER MAIN;
   H. 5–FT FROM DISTRIBUTION BOX;
   I. 15–FT MINIMUM HORIZONTAL DISTANCE TO GROUND SURFACE; AND
   J. 5–FT FROM ON SITE DOMESTIC WATER SERVICE LINE.

   SETBACKS LISTED HERE ARE MINIMUM VALUES ONLY – CONSULT MPC FOR ADDITIONAL DETAILS AND CLARIFICATIONS REGARDING REQUIRED SETBACKS FOR DISPOSAL FIELDS.
4. SETBACKS ARE FROM EDGE OF FULLY DEVELOPED DISPOSAL FIELD.
5. PRIOR TO COMMENCEMENT OF EXCAVATION, AN EXCAVATION PERMIT SHALL BE OBTAINED BY OTHERS.

Job: FEFFER/COLOREA – 1992-75

Reference: Laboratory Testing, Soil Labworks, LLC., December 27, 2017 and June 28, 2019

Laboratory testing for the subject property was performed by Soil Labworks, LLC., under the supervision of the undersigned Engineer. Previous work is presented in the referenced report. Samples of the earth materials were obtained from the subject property by personnel of Feffer Geological and transported to the laboratory of Soil Labworks for testing and analysis. The laboratory tests performed are described and results are attached.

Services performed by this facility for the subject property were conducted in a manner consistent with that level of care and skill ordinarily exercised by members of the profession currently practicing in the same locality under similar conditions.

Respectfully Submitted:

APPENDIX

Laboratory Testing

Sample Retrieval - Hand Labor

Bulk bags sample of earth materials was obtained from a stockpile on site for transportation to the laboratory.

Grain Size Distribution

The grain size distribution of selected soil samples was determined using sieves and a hydrometer in conformance with the moist recent version of ASTM D4221-18. The distribution of soil particle size is shown on the Grain Size Distribution charts. The test results are also presented on the table below.

Table 13 Setback Reductions

SETBACK REDUCTIONS

	COMPONENT	SITE ELEMENT	CODE REQUIREMENT	ACTUAL
1	DISPERSAL FIELD	SITE WALL	8'	1'-0"
2	DISPERSAL FIELD	DECK	8'	1'-0"

PART 2 – INTRODUCTION

This report summarizes the results of the geologic investigation and provides engineering design for the onsite wastewater treatment/disposal system for the above noted site. The following work is to be performed on the subject site:

- Total six (6) bedrooms, including one (1) master bedroom, in two proposed structures with 121 total fixture units.

PART 3 – SCOPE OF WORK

We completed the following work for this study:

- Prepared this written report summarizing the soils engineering investigation.
- Provided engineering design criteria for the proposed onsite wastewater treatment/disposal system.

PART 4 – FINDINGS

1) Soils Testing [5] [4]

According to the referenced geology/percolation report [5] subsurface dispersal infiltration testing was performed on the subject site in the areas shown in the referenced plan [1]. Seven (7) infiltration test trenches were excavated on the subject site and testing was performed in seven (7) locations. These tests were conducted in general compliance with City of Malibu Soil Analysis/Infiltration Report Procedure [7, p. 15].

Atascadero, CA
93422

Tel: 805.772.0150
Fax: 805.772.0813

ensitu@ensitu.com

2) Fixture Units [2] [3] [6] [7]

A Fixture Count was performed in accordance with the City of Malibu Fixture Unit Worksheet [7, p. 44] and Drainage Fixture Unit values in the current edition of the California Plumbing Code for the subject site. The subject property has 121 total fixture units.

3) Wastewater Flow [2]

a) Design/Peak Flow

The design/peak flow for a single-family residence in the City of Malibu is estimated using 300 gallons per day (gpd) for the first bedroom and 150 gpd for each additional bedroom. The subject project has a total of six (6) bedrooms, including one (1) master bedroom, in two proposed structures; therefore, the peak flow is 1050 gpd and the design flow is 1050 gpd.

b) Average Flow

The average flow for a single-family residence in the City of Malibu is estimated using 200 gpd for the first bedroom and 100 gpd for each additional bedroom. The average flow for the proposed house is estimated at 700 gpd.

PART 5 – PROPOSED DESIGN [2] [1]

1) Septic Tank

Septic tank sizing shall be based on the fixture unit count. The subject residence has a fixture count of 121; therefore, the minimum septic tank capacity required is 4,025 gallons. A MicroSepTec ES25 treatment tank is proposed with a capacity of 7,540 gallons.

Table 14 Required and Design Septic Tank Capacity

Atascadero, CA
93422

Tel: 805.772.0150
Fax: 805.772.0813

ensitu@ensitu.com

2) Treatment

A MicroSepTec ES25 treatment tank shall be used to treat the waste before being discharged to the disposal area. The proposed treatment tank has multiple compartments for primary settling, aerobic treatment, final clarification, and effluent storage.

Table 15 MicroSepTec Organic and Hydraulic Design

MicroSepTec Design

MicroSepTec ES12	1200	220	20	2.00
MicroSepTec ES25	2500	220	20	4.17

3) Disinfection

Disinfection shall be performed using a gravity flow ultraviolet (UV) disinfection unit integrated within the MicroSepTec unit. The treated effluent shall then be pumped from the effluent storage compartment of the treatment tank to the disposal area.

4) Disposal

Dispersal shall be performed using a subsurface drip dispersal system.

The subsurface drip dispersal system shall use Geoflow Wasteflow Subsurface Drip Systems. The Wasteflow drip system disperses of effluent below the ground surface through ½ inch pressure compensating tubing. The treated wastewater shall be pumped from the dosing compartment to the dispersal area shown on the site plan.

The subsurface drip dispersal area shall be a total of 5,100 square feet in one (1) zone. According to the infiltration report the minimum passing infiltration rate for tests in the infiltrations area was 3.9 gallons per square foot per day (gpsfd) applying a safety factor of 10 the maximum field application rate should be 0.39 gpsfd.

PART 6 – EXISTING ONSITE SYSTEM

1) Existing OWTS Components

a) Contractor is responsible for locating all existing onsite wastewater treatment system (OWTS) components. The locations on the engineering plans, and indicated in this report, are based on permit information and/or survey information provided and may not include all components of the OWTS. Many items, such as tanks, piping, distribution devices, seepage pits, dispersal fields, and other appurtenances are buried and not locatable by the surveyor or utilities locator.

2) Abandonment of Existing System

a) Prior to commencing work to abandon, remove, or replace existing onsite wastewater treatment system (OWTS) components an "OWTS abandonment permit" shall be obtained from the city of Malibu. All work performed in the OWTS abandonment, removal, or replacement area shall be performed in strict accordance with all applicable federal, state, and local environmental and occupational safety and health regulatory requirements. The obtainment of any such required permits or approvals for this scope of work shall be the responsibility of the applicant and their agents.

b) Existing OWTS components shall be abandoned in accordance with title 28 of the Los Angeles County Code, incorporating the most current California Plumbing Code, local plumbing code, and policies. Method of abandonment shall be determined by the engineer and/or the owner's representative.

SETBACK REDUCTIONS

	COMPONENT	SITE ELEMENT	CODE REQUIREMENT	ACTUAL
1	DISPERSAL FIELD	SITE WALL	8'	1'-0"
2	DISPERSAL FIELD	DECK	8'	1'-0"

1) Dispersal Field to Site Wall

Site wall foundation will need to be certified by structural engineer and geotechnical engineer during final plan check phase of the project. If current foundation cannot support the site wall with reduced setback additional foundation work will need to be designed by project consultants or the wall will need to be removed.

2) Dispersal Field to Deck

Deck foundation will need to be certified by structural engineer and geotechnical engineer during final plan check phase of the project. If current foundation cannot support the site wall with reduced setback additional foundation work will need to be designed by project consultants or the wall will need to be removed.

PART 8 – DISTRIBUTION

This report should be sent to all the design consultants for the above project including: architect; structural engineer; geologist; geotechnical engineer; coastal engineer; civil engineer; and others.

1/1 OVERALL SITE PLAN

0 100' 200'

SCALE: 1" =100'-0"

GENERAL NOTES:

1. EXISTING OWTS COMPONENTS LOCATION AND ABANDONMENT:
   - 1.1. CONTRACTOR IS RESPONSIBLE FOR LOCATING ALL EXISTING ONSITE WASTEWATER TREATMENT SYSTEM (OWTS) COMPONENTS. THE LOCATIONS ON THE ENGINEERING PLANS ARE INFORMATIONAL AND MAY NOT INCLUDE ALL COMPONENTS OF THE OWTS. MANY ITEMS, SUCH AS TANKS, PIPING, DISTRIBUTION DEVICES, SEEPAGE PITS, DISPERSAL FIELDS, AND OTHER APPURTENANCES ARE BURIED AND NOT LOCATABLE BY THE SURVEYOR OR UTILITIES LOCATOR .
   - 1.2. PRIOR TO COMMENCING WORK TO ABANDON, REMOVE, OR REPLACE EXISTING ONSITE WASTEWATER TREATMENT SYSTEM (OWTS) COMPONENTS AN "OWTS ABANDONMENT PERMIT" SHALL BE OBTAINED FROM THE CITY OF MALIBU. ALL WORK PERFORMED IN THE OWTS ABANDONMENT, REMOVAL, OR REPLACEMENT AREA SHALL BE PERFORMED IN STRICT ACCORDANCE WITH ALL APPLICABLE FEDERAL STATE, AND LOCAL ENVIRONMENTAL AND OCCUPATIONAL SAFETY AND HEALTH REGULATORY REQUIREMENTS. THE OBTAINMENT OF ANY SUCH REQUIRED PERMITS OR APPROVALS FOR THIS SCOPE OF WORK SHALL BE THE RESPONSIBILITY OF THE APPLICANT AND THEIR AGENTS.
   - 1.3. THE EXISTING OWTS COMPONENTS INCLUDING; SEPTIC TANK(S), PIPING, CLEANOUT(S) SEEPAGE PIT(S), DISPERSAL FIELD(S), AND ALL OTHER APPURTENANCES SHALL BE PROPERLY ABANDONED PURSUANT TO CITY OF MALIBU ORDINANCE 435, SECTION 15.40.170 G, AND SECTION 15.40.170 D, TITLE 28 OF THE LOS ANGELES COUNTY CODE, INCORPORATING THE MOST CURRENT CALIFORNIA PLUMBING CODE, LOCAL PLUMBING CODE, AND POLICIES. METHOD OF ABANDONMENT SHALL BE DETERMINED BY THE ENGINEER AND/OR THE OWNER'S REPRESENTATIVE
2. SEWER PIPE SHALL BE BEDDED IN ACCORDANCE WITH SPECIFICATIONS AND TITLE 28 OF THE LOS ANGELES COUNTY CODE, INCORPORATING THE MOST CURRENT CALIFORNIA PLUMBING CODE, LOCAL PLUMBING CODE, AND ORDINANCES.
3. SYSTEM COMPONENTS AND APPURTENANCES (INCLUDING CLEAN-OUTS, VENTS, BACKWATER VALVES, ETC.) SHALL BE INSTALLED IN ACCORDANCE WITH TITLE 28 OF THE LOS ANGELES COUNTY CODE, INCORPORATING THE MOST CURRENT CALIFORNIA PLUMBING CODE, LOCAL PLUMBING CODE, AND POLICIES.
4. ELECTRICAL COMPONENTS AND APPURTENANCES SHALL BE INSTALLED IN ACCORDANCE WITH TITLE 27 OF THE LOS ANGELES COUNTY CODE, INCORPORATING THE MOST CURRENT CALIFORNIA ELECTRICAL CODE, LOCAL ELECTRICAL CODE, AND ORDINANCES.
5. A REGISTERED GEOTECHNICAL ENGINEER, UNDER THE DIRECTION OF THE OWNER, SHALL DETERMINE IF THE WASTEWATER LOADING RATE WILL CAUSE THE EXISTING SLOPE TO BECOME UNSTABLE. ENSITU ENGINEERING INC., IS NOT A GEOTECHNICAL ENGINEERING FIRM, THEREFORE, WE CAN NOT PREDICT AND/OR DETERMINE THE STABILITY OF THE EXISTING SLOPE.
6. THE PROJECT ENGINEERING GEOLOGIST SHALL OBSERVE THE INSTALLATION OF THE TANK AND DISPERSAL SYSTEM COMPONENTS OF THE AOWTS (INCLUDING BUT NOT LIMITED TO; (A) TANK EXCAVATION, BEDDING, AND BACKFILL (B) SEEPAGE PITS EXCAVATION, CONSTRUCTION, AND BACKFILL (C) SUBSURFACE DISPERSAL SYSTEM BEDDING, FILL MATERIAL, CONSTRUCTION, AND BACKFILL) AND PROVIDE THE CITY INSPECTOR WITH A FIELD MEMORANDUM(S) DOCUMENTING AND VERIFYING THAT THE TANK AND DISPERSAL SYSTEM COMPONENTS WERE INSTALLED PER APPROVED AOWTS PLANS.
7. LEACH FIELDS AND DISPERSAL SYSTEMS DESIGNATED AS SAND CATEGORY: ANY REMAINING FILL MATERIAL AND ANY BEACH SAND SEDIMENT THAT MIGHT HAVE REDUCED PERMEABILITY FROM EXISTING LEACH FIELD OPERATIONS ENCOUNTERED BELOW THE BOTTOM OF THE PROPOSED LEACH FIELD OR ANY MATERIAL ENCOUNTERED IN THE CONSTRUCTION OF THE LEACH FIELD THAT IS NOT CATEGORIZED AS BEACH SAND DEPOSITS SHALL BE EXCAVATED TO THE LEVEL OF THE NATIVE BEACH SAND DEPOSITS AND REPLACED WITH DOUBLE- WASHED SAND. THE PROJECT ENGINEERING GEOLOGIST SHALL OBSERVE THE EXCAVATION OF THE LEACH FIELD AND CONFIRM IN WRITING THAT ALL THE DELETERIOUS FILL AND NON-BEACH SAND MATERIALS BELOW THE LEACH FIELD HAVE BEEN REMOVED AND REPLACED WITH CLEAN SAND AND THE LEACH FIELD WAS CONSTRUCTED IN ACCORDANCE WITH THE APPROVED OWTS PLANS.
8. SUBSURFACE DRIP LINE SHALL BE PLACED IN UNCOMPACTED NATIVE SOILS RIPPED AND TILLED A MINIMUM OF 18 INCHES. SOIL SHALL BE AMENDED TO BE 30% SAND, 30% MULCH, 40% NATIVE OR LANDSCAPE DESIGNER SHALL BE CONTACTED TO ADVISE CONTRACTOR ON TYPE OF TOPSOIL TO IMPORT FOR MINIMUM BURIAL DEPTH. DISPERSAL FIELD SHALL BE PLANTED AND ESTABLISHED PRIOR TO OCCUPANCY (ENGINEER TO VERIFY)
9. ALL DIMENSIONS AND GRADES SHALL BE VERIFIED BY CONTRACTOR PRIOR TO SYSTEM INSTALLATION. BUILDING SEWER DEPTH OR CONNECTION POINT WAS NOT PROVIDED AND SHALL BE DETERMINED BY CONTRACTOR PRIOR TO CONSTRUCTION
10. CONTRACTOR TO VERIFY DEPTH AND LOCATION OF BUILDING SEWER CONNECTION. MINIMUM 2% SLOPE FROM STRUCTURE TO CONNECTION POINT.
11. ONSITE WASTEWATER TREATMENT SYSTEM SHALL BE VENTED IN ACCORDANCE WITH TITLE 28 OF THE LOS ANGELES COUNTY CODE, INCORPORATING THE MOST CURRENT CALIFORNIA PLUMBING CODE, LOCAL PLUMBING CODE, AND POLICIES.

Please respond —

This project at **25200 Pacific Coast Highway** cannot lawfully proceed without a **variance for the factor of safety prior to any discretionary approval**. Under the Malibu Local Coastal Program and **LIP §9.4(D)**, new development proposed on landslides may be permitted **only where a factor of safety of 1.5 (static) and 1.1 (pseudostatic) can be demonstrated**, based on **worst-case geologic and slope gradient conditions**, examining both overall slope stability and surficial units.

Because mitigation and stabilization measures necessarily improve site conditions, the "worst-case" condition required by **LIP §9.4(D)** must reflect **existing, pre-mitigation site conditions**, unless deviations from those standards are expressly approved through a variance pursuant to **LIP §13.26**. Where a site cannot meet the required factor of safety under existing conditions, **LIP §13.26** provides the sole lawful mechanism through which proposed mitigation and construction measures may be evaluated and weighed against public safety, adjacent properties, and the public interest, as required by **LIP §13.26.5(B)** and **Coastal Act §30253**. Absent an approved variance, the City may not rely on assumed future stabilization or construction to make the findings required under the LCP.

Allowing mitigation measures to be incorporated into the baseline slope stability analysis would directly contradict the structure and purpose of the LCP. If mitigation were permitted in the baseline condition, there would be no meaningful "worst-case" analysis, **LIP §9.4(D) would be rendered meaningless**, and the variance provisions of **LIP §13.26** would never be triggered. The Coastal Commission has consistently rejected that interpretation. **LIP §13.26 exists precisely because some sites cannot meet the requirements of §9.4(D) under existing conditions.** If applicants were permitted to add piles, retaining walls, caissons, or other stabilization measures and then claim compliance without a variance, no variance would ever be required. **Such an interpretation would unlawfully allow applicants to bypass LIP §13.26, rendering the variance provisions meaningless and defeating the LCP's required framework for reviewing and approving deviations from slope stability standards.**

This site lies within the **Malibu Road Landslide Assessment District**, and even the applicant's own geotechnical consultants confirm that the **existing factor of safety is well below 1.5 prior to any mitigation or construction**. Those conditions constitute the **worst-case geologic scenario** required to be evaluated under **LIP §9.4(D)** and must be addressed **before approval**, not assumed away through future piles or construction that has not yet occurred. Where the existing factor of safety for the landslide mass is substandard, the **entire landslide area is constrained**, and any attempt to selectively redefine buildability through consultant-defined "no-build zones" is improper and cannot substitute for the findings required under a variance.

CC: Planning Commission, PD,

Recording Secretary, File

Date Received 12/16/25 Time 12:22 p.m.
Planning Commission meeting of 12/16/25
Agenda Item No. 5C
Total No. of Pages 11

Accordingly, a **variance is required before any planning approvals**, before reliance on piles or stabilization systems, and **before the project may proceed to the Planning Commission**. The City cannot lawfully make findings based on construction or mitigation that does not yet exist. Just as **Fire Rebuild Option 4** improperly relied on future construction to justify exemptions, this project improperly relies on future stabilization to justify safety findings—yet the law requires those findings to be based on **existing conditions or on mitigation and construction measures evaluated and approved through a duly granted variance**, not on hypothetical outcomes.

This is not a discretionary judgment call; it is a **threshold compliance requirement**. Proceeding without a variance wastes City staff time, Planning Commission time, and ultimately City Council time—while fire-affected residents wait for lawful rebuild approvals. This application should therefore be returned to Planning immediately for variance processing.

The City has already addressed this exact issue in **Big Rock at Piedra Chica Road**, where a significantly smaller project—an addition exceeding 10 percent but less than 50 percent of an existing residence—was nonetheless required to apply for a **factor-of-safety variance**. That application went to the Planning Commission multiple times, was appealed to the City Council, and could not be heard because the variance had not been processed. It was returned because, as a matter of law, **the project could not proceed without a variance**. That outcome followed the unnecessary expenditure of time and resources by staff, appellants, the Planning Commission, and the City Council.

Here, the proposal is not a modest addition—it is a **12,000-square-foot new construction project with multiple underground components on an active landslide**. The same legal requirement applies, with even greater force.

Specifically, the finding required under **LIP §13.26.5(B)**—that *"the granting of such variance will not be detrimental to the public interest, safety, health or welfare, nor injurious to property in the vicinity"*—**can only be made through the variance process**, not through standard project approval. Excavation alone on this site has the potential to impact adjacent properties and destabilize the landslide mass, which is precisely why the variance process exists.

For these reasons, this item should be **continued to a date uncertain** until the required variance is formally applied for, evaluated, and supported by findings. Your department was notified of this issue more than **three months ago**, yet the application continues to be processed in a manner inconsistent with the LCP.

Please remove this application from staff and Planning Commission consideration so limited City resources can be focused on **urgent fire rebuilds**, the majority of which are **modest homes averaging approximately 3,000 square feet**, not speculative **12,000-square-foot developments**.

Thank you,
Jo Drummond
On behalf of **Malibu Township Council**

2021.11.18 Final Geotechnical Report re PARPCH.pdf

Re: 25200 Pacific Coast Highway – Request for Nullification of Approvals Due to Non-Compliance with LCP, LIP §9.4(D), CEQA, and Building Code Requirements

Attention:
Alison Cook – Contract Planner
Trevor Rusin - Interim City Attorney
Yolanda Bundy – Building Official/Community Development Director
Tyler Eaton – Assistant Community Development Director
Rob DuBoux – Head of Public Works

Dear Staff,

Malibu Township Council writes to formally request that the City **nullify all approvals** associated with the proposed development at **25200 Pacific Coast Highway**, as the administrative record clearly demonstrates that the project **violates the Malibu LCP**, **fails to comply with LIP §9.4(D)**, **requires—but has not requested—a variance**, and **is not eligible for CEQA exemptions**.

We attach for reference the **April 26, 2021** letter from **Elkins Kalt**, which resulted in the indefinite continuance of a **770 sq ft addition** at **20238 Piedra Chica Road**—also in the Big Rock Landslide Assessment District. That project was halted because it:

1. did not conform to the LCP,
2. required a variance,
3. did not comply with applicable building code sections, and
4. was not exempt from CEQA.

The same facts—and in this case, far more severe ones—are present at 25200 PCH, where the proposal is not a minor addition but an entirely new **12,000-square-foot** development with a basement, underground garage, multiple pools, extensive grading, and substantial new loading on an active landslide.

---

1. The Project Cannot Lawfully Proceed Because It Does Not Meet the Required Factor of Safety Under LIP §9.4(D)

LIP §9.4(D) mandates:

> "New development proposed on landslides… shall be permitted **only <u>where</u> a factor of safety of 1.5 (static) and 1.1 (pseudostatic) can be provided**."
>
> "Analyses shall demonstrate a factor of safety ≥ 1.5 for static and ≥ 1.1 for seismic… **modeling <u>worst-case</u> geologic and slope gradient conditions**."

Critically, these analyses must evaluate **the natural, pre-construction slope condition**—**before** piles, grading, or stabilization.

The applicant's own geotechnical consultant explicitly admits that the site cannot meet the required factor of safety without major engineered stabilization.

In the March 25, 2021 translational stability analyses incorporated into the November 18, 2021 Feffer Report attached, the consultant concludes:

> **"Preliminary static analyses of translational stability [were] achieving factors of safety slightly greater than 1.0…"**
> (Feffer, 3/25/21, incorporated in 2021.11.18 report p 563)

These reported FS values (**1.094 – 1.186**) are **far below the required 1.5 threshold.**

Feffer then makes an unequivocal admission in the November 18, 2021 report on p 6:

> **"The analyses indicate that the existing slopes require a stabilization system to achieve a 1.5 and 1.0 factor of safety and to mitigate potential geologic instability."**

This statement is dispositive:

• The natural slope does not meet LIP §9.4(D).

• A stabilization system is required just to approach minimum safety.

• Therefore, a variance is legally required under LIP §13.26.

There is **no discretion** to avoid the variance. The LIP does not allow "mitigated compliance"—it requires **natural-condition compliance**.

Because the project fails this mandatory test, all project approvals must be nullified.

---

2. A Variance Is Required Under LIP §13.26 – and None Has Been Requested

LIP §13.26 states:

> "A variance shall not be granted which confers a special privilege… A variance is required for any deviation from the standards or requirements of the Malibu LIP."

This project deviates from the most fundamental geologic safety standard in the LCP.

The applicant:

- Cannot meet FS 1.5 (static) or 1.1 (seismic) in the actual landslide condition;
- Admits stabilization is required *before* compliance;

- Provides no natural-condition cross-sections achieving required safety levels;
- Attempts to substitute “post-construction” modeling for required baseline analyses.

Therefore:

A variance is legally required before any further review.

And critically:

This application cannot lawfully proceed to the Planning Commission because, under the LCP and LIP §13.26, and the City’s own geotechnical standards, a variance must be obtained before any further processing, and no such variance has been applied for or evaluated. The City has no authority to advance the project to public hearing without first satisfying this mandatory prerequisite.

---

3. The Project Is Not the Least Environmentally Damaging Alternative Required by LIP §9.4(E)

LIP §9.4(E) requires:

> “Measures to remediate or stabilize landslides… shall be designed to be the **least environmentally damaging alternative** and to minimize landform alteration.”

This project represents the **opposite**:

- Over **12,000 sq ft** of development
- A full basement and underground garage
- **12 bedrooms and bathrooms**
- Multiple pools and water features
- A septic system exceeding **7,500 gallons**, dispersing **over 1,000 gallons/day** into unstable soil

Former City Geologist **Donald B. Kowalewsky** warned in 2018 (20272 Inland Lane) included in the Elkins Kalt letter attached:

> **“The introduction of additional mass and water into the ground in Big Rock Mesa will result in a lower safety factor.”**

Yet this project dramatically **increases** both mass and water, directly contrary to expert guidance and LIP §9.4(E).

The Feffer report further acknowledges the extensive mitigation required simply to make the slope marginally stable:

> "**The existing slopes require a stabilization system to achieve a 1.5 and 1.0 factor of safety…**"

A development that **requires** massive stabilization on an **active landslide** cannot be considered the least environmentally damaging option.

---

4. Deep Pile Embedment (~100 ft) Into a Known Landslide Is Geologically Dangerous and Unsupported

The only numerical pile lengths disclosed anywhere in the Feffer report appear in the **Slide model output**, showing piles approximately **99–112 feet deep**.

Such extreme embedment:

- Penetrates directly into the landslide mass;
- Risks disturbing or reactivating shear zones;
- Alters stress conditions in very weak materials (residual $\varphi = 16°$, $c = 200$ psf);
- Creates new stress concentrations and potential slip surfaces;
- Redirects groundwater in ways that may further destabilize the slope.

Yet the report provides **no geologic justification** demonstrating these ~100-foot piles will not worsen slope instability. Despite this, the applicant relies on these same unverified piles to claim compliance with LIP §9.4(D)—which is impermissible.

This further reinforces the necessity of a **variance** and independent geotechnical review.

---

5. CEQA Exemptions Do Not Apply Due to Unusual Circumstances and the Probability of Significant Environmental Impacts

An active landslide, extensive subsurface disturbance, increased water load, and a known broken pipe beneath the property constitute **unusual circumstances** under CEQA Guidelines §15300.2(c).

There is a clear "**reasonable possibility of a significant effect**" due to:

- Instability of the landslide mass;
- Added mass and water;
- Deep pile installation;

Existing saturation from broken infrastructure.

Therefore, **categorical exemptions cannot apply.**

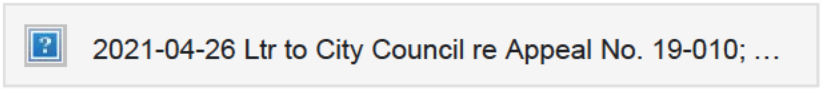
Conclusion

Because:

- The **natural slope fails** to meet LIP §9.4(D),
- The applicant's geotechnical consultant **admits stabilization is required** to reach minimum FOS,
- The project **requires—but has not applied for—a variance**,
- The proposal is **not** the least environmentally damaging alternative,
- Deep piles pose significant risk to the landslide mass, and
- CEQA exemptions **cannot lawfully be used**,

all project approvals must be nullified.

Furthermore, this application cannot lawfully move forward to the Planning Commission because, under the LCP, LIP §13.26, and the City's own geotechnical standards, a variance must be obtained before any further processing. No such variance has been submitted or evaluated. The City therefore has no authority to advance the project to public hearing until this mandatory prerequisite is satisfied.



This is precisely the kind of egregious, non-compliant project that has contributed to Malibu's backlog and undermined public confidence during the city's rebuild recovery—just as occurred with the Malibu Inn Hotel, whose geotechnically unsound 55-foot retaining wall triggered extensive delays, appeals, and ultimately rejection by the City Council. That outcome could and should have been avoided entirely had Planning identified the non-compliance early, instead of forcing residents, the City Council, and City staff to expend hundreds of hours producing and reviewing voluminous, non-compliant staff reports that should never have been necessary at all, and were the direct result of avoidable failures in the early compliance review—failures that burdened staff, misled decision-makers, and forced residents to correct issues that should have been caught immediately.

Malibu Township Council urges the City to uphold the LCP, protect public safety, and halt all further action on this application unless and until it demonstrates full compliance with all applicable laws.

Sincerely,

Jo Drummond

Malibu Township Council

Attention: Planning Commission, Yolanda Bundy, Tyler Eaton, and Trevor Rusin

The Malibu Township Council (MTC) previously submitted letters on July 21 and August 10 (both attached) regarding the Weintraub project. To date, those concerns have not been addressed. The most critical omission remains the failure to comply with **LIP §9.4D** (attached), which requires all new development in landslide areas to demonstrate a factor of safety of 1.5 (static) and 1.1 (pseudostatic). If those thresholds cannot be met, a variance must be obtained.

This project is a **brand-new, over 12,000 sq. ft. construction** in the Malibu Road Landslide Assessment District. Unlike routine fire rebuilds, this is a discretionary proposal on an undeveloped lot. In a past case at **20238 Piedra Chica Rd**, even a 25% addition had to be sent back after Planning Commission and City Council review when it was discovered no variance had been filed under §9.4D. That error wasted nearly three years of city resources. Approving this project without the variance requirement addressed risks repeating the same mistake.

Compounding the problem, there is a **broken and leaking Caltrans storm drain pipe under this property** that has caused multiple landslides in the past. The City's Public Works Director, Rob Duboux, has confirmed this on record. The applicant does not have the authority to repair this pipe, and the matter must be resolved by Caltrans **before any approvals can be considered**.

Beyond geotechnical hazards, the project would also cause **substantial obstruction of public scenic views**, contrary to the LCP.

MTC recognizes that Planning staff are managing hundreds of Woolsey and Palisades Fire

rebuilds—work that should be the City's top priority. **Oversights like the missing variance requirement reflect how stretched staff have become, and why their focus must remain on rebuilding Malibu rather than processing code-violating projects like this one.**

For efficiency, and to prevent further waste of time and resources, **MTC requests that this item be removed from the agenda until**:

1. The applicant files for the required variance under **LIP §13.26.5**,
2. All slope stability studies required by **LIP §9.4D** are completed,
3. The broken Caltrans storm drain pipe is repaired by the responsible agency, and
4. Public view obstruction impacts are fully mitigated.

Under **LIP §13.26.5**, a variance can only be approved if all of the following findings are made, supported by substantial evidence:

- **A.** Special circumstances exist such that strict application of the code would deprive the property of privileges enjoyed by others in the vicinity.
- **B.** The variance will not be detrimental to the public interest, safety, health or welfare, and will not be detrimental or injurious to the property or improvements in the same vicinity and zone(s) in which the property is located.
- **C.** The variance will not confer a special privilege.
- **D.** The variance will not conflict with the purposes and intent of the LCP.
- **E.** For variances to ESHA standards: no feasible alternative exists, and allowable development area is not exceeded.
- **F.** For variances to stringline standards: maximum feasible protection to public access is provided.
- **G.** The request is consistent with the purpose and intent of the zoning designation.
- **H.** The subject site is physically suitable for the variance.
- **I.** The variance complies with all requirements of state and local law.
- **J.** The variance does not reduce or eliminate public parking for beach, trail, or park access.

Given the project's size, location in a landslide district, unresolved infrastructure issues, and public view impacts, **most of these findings will be extremely difficult to satisfy.**

Thank you,

Jo Drummond
Malibu Township Council

On Aug 10, 2025, at 12:19 PM, Malibu Township Council [redacted] wrote:

Urgent: Weintraub Application Missing Required LIP 9.4D Variance

Dear Yolanda,

The most critical omission in the Weintraub application is the required compliance with LIP 9.4D. Under this section, any new development in a landslide, steep slope, unstable soil, or other geologic hazard area must demonstrate, through slope stability analysis, a factor of safety of at least 1.5 (static) and 1.1 (pseudostatic). If this cannot be met, the applicant must obtain a variance and satisfy the ten findings in LIP 13.26.5 before moving forward. The Project is "new development" as defined by the LCP. It consists of land-disturbing activities including but not limited to, construction of a building or structure that will increase the floor area by more than ten percent. LCP, LIP §2.1.

We've been here before: in the Big Rock case at 20238 Piedra Chica Rd (CDP 18-002), the city had to send the project back to Planning for a variance application—after it had already gone through the Planning Commission and City Council (April 26, 2021) review —because no variance had been filed for the factor of safety. That error wasted nearly three years of staff, commission, and council time. The Weintraub property lies within the Malibu Road Landslide Assessment District, as noted in the latest staff report, yet none of the required 9.4D studies have been completed. Without those studies, the application cannot demonstrate the required factor of safety and is not eligible to proceed without a variance.

Such an attempt to sidestep the LCP is improper, and City Planning must deny the Project for its failure to conform with the LCP. As the LIP takes precedence over the City-adopted County and State Building Code, the City cannot discard development standards and variance requirements under the LCP. Especially where there are no noted impediments to complying with both the LCP and building codes. The Project applicant must file and process a variance to comply with the LCP.

For efficiency and to avoid repeating past mistakes, I request this item be removed from the agenda until the applicant applies for the variance and submits the required slope stability studies. Proceeding without these steps would not only repeat the Piedra Chica error but could also expose the city to significant legal and procedural risk.

Finally, LCP, LIP Section 9.4.M prohibits new development "on property or in areas where such development would present an extraordinary risk to life and property due to an existing or demonstrated potential public health and safety hazard."

I understand that many of these errors are due to the Palisades Fire and the need to rush applications already in planning but this needs to STOP and they all need to be put at the end of the line when there is more time to focus on HUGE code reaching projects. The focus NOW needs to be on the recovery of our community and rebuilding homes up to 10%.

Thank you,

Jo Drummond

RE: Applicant's Response to Jo Drummond letter dated December 12, 2025, Re: CDP No. 19-012 Lot Merger 24-002, COC No. 19-009, for the property located at 25200 PCH, Malibu, CA 90265 (APNs: 4459-013-021; 4459-014-018) -- **ITEM 5.C. 2025.12.16 Planning Commission Hearing**

Honorable Chair Leonard and Commissioners,

Please find below the Applicant's responses to the comments submitted by Ms. Jo Drummond in the correspondence referenced above:

1. **Geology & Soils:**

Comment A: Ms. Drummond alleges that a Variance is required, pursuant to LIP Sec. 9.4(D), because the project site does not meet the static and pseudostatic factors of safety required by the LCP and City's Geotechnical Guidelines.

Applicant Response A: Nothing in any code requires that a site must meet the slope stability factors of safety *in its pre-development condition*. Ms. Drummond misinterprets the code. No Variance is required.

Comment B: Ms. Drummond provides extensive reference to a residential remodel project in Big Rock (East Malibu) in support of her request to stop review and processing of the applicant's project.

Applicant Response B: Ms. Drummond is not a geologist, nor does she have any expertise in the field. She offers her lay opinion on matters that are far beyond her knowledge or understanding. She attempts to analogize a residential remodel project in Big Rock several miles away from the 25200 property. The Big Rock project was located in a Massive landslide that encompasses the entire neighborhood. The applicant's proposed development is NOT located in a landslide but adjacent thereto. The Piedra Chica project in Big Rock could not meet the requisite factors of safety required by code, even with site stabilization efforts; whereas the applicant's project meets and exceeds the required factors of safety. Having said that, geology is a science, not part of the humanities. A property's geology is site specific and cannot be likened to another with completely different geology. The Piedra Chica project has no relevance or bearing on the geology of 25200 PCH or the applicant's project.

Comment C: Ms. Drummond argues that the project does not meet the requirements of LIP 9.4(E) which states in part, "Measures to remediate or stabilize landslides... shall be designed to be the least environmentally damaging alternative and to minimize landform alteration."

Applicant Response to Comment C: Ms. Drummond cites the correct code provision and then misapplies the facts to the rule. LIP Sec. 9.4(E) does not relate to the nature or scope of the residential development itself. This section requires that any remedial or preventative measures recommended by a soils or geotechnical engineer [related to landslide stabilization only] be most protective of views and seek to limit to the maximum extent feasible, landform alteration. The project's use of deepened foundations is consistent with this requirement. Also, the project does not propose ANY development within the landslides that abut the property/ development area.

Comment D: Ms. Drummond argues that deep pile embedment into a known landslide is geologically dangerous and unsupported.

Applicant Response to Comment D: No portion of the project, including the Piles, is proposed within a landslide; NONE. The piles are located to the north and to the west of the landslides which are largely located off property to the south and to the east. This comment is completely inaccurate. Her other comments regarding site stability and soils conditions

are lay opinion not based on science and the city has reviewed and dismissed these comments as inaccurate.

2. **California Environmental Quality Act (CEQA)**

Comment E: Ms. Drummond argues that various adverse geologic conditions on the property creates “unusual circumstances” that preclude the City from utilizing a Categorical Exemption from CEQA.

Applicant’s Response to Comment E: The project is categorically exempt from CEQA (Class 3). Ms. Drummond mischaracterizes and misinterprets the CEQA standard of review under the Berkley Hillside case [*Berkeley Hillside Preservation v. City of Berkeley* (2012) 203 Cal.App.4th 656.]. Ms. Drummond claims that the proximity of landslides near the project creates "unusual circumstances" that would exclude an otherwise categorically exempt project from a Class 3 CEQA exemption.

There were very similar facts in the Berkley Hillside case, where the city of Berkely approved a 10,000 sq. ft. single-family home within a mapped landslide and fault zone with remedial measures having been implemented to improve site stability. The City found that the mere presence of challenging geologic conditions on the property did not result in 'unusual circumstances' that would make the use of a Categorical CEQA exemption inappropriate. The Supreme Court of California upheld the City's decision to approve the CEQA Exemption, and the city's finding that the challenging geologic conditions did not constitute an unusual circumstance.

The applicant's project has an analogous fact set and an even stronger argument than the applicant in the Berkley Hillside case, because unlike the Berkely project, the applicant's project does not propose any development within a mapped landslide zone. The applicant's project proposes to significantly reduce the load on the adjacent landslides through the use of a pile and tieback system. This takes weight off the hillsides to the south and east of the project site, where the landslides are located, and provides improved stability to the existing homes located on Bayshore Dr. and Malibu Rd., which are located in the actual landslides. The project will have a net beneficial effect for the neighbors below.

Conclusion/ Comment F: Ms. Drummond refers to the project as "egregious…non-compliant…" She argues that the project is geotechnically unsound and its review is a waste of time and resources.

Applicant Response to Comment F: These comments contain only hyperbole, misstatement of fact, and lay opinion. They are not instructive to the Commission or relevant to the applicant's project. To the extent that Ms. Drummond does not want *any* new development in Malibu, message received.

Sincerely,

Chris Deleau, JD, AICP

On August 18, 2025, the Planning Commission continued the item to a date uncertain at the request of staff to allow additional time to address public correspondence related to geologic issues.

Was the "new" Kanan corridor seismic zone added in. You know we had many local earthquakes last year: quite the disruption for PTSD-effects.

FEBRUARY 9, 2024 3:06 PM

Seismologist Dr. Lucy Jones discusses 4.6-magnitude earthquake that hit Malibu

Sep 12, 2024, 9:20 AM

to Janice

[Magnitude 4.7 earthquake in Malibu rattles Southern California - AOL]

Today: The quake was centered in the Malibu hills off Kanan-Dume Road around Ramirez Canyon. It was 6.8 miles deep.

The earthquake epicenter was closest to the Malibu fault, said seismologist Lucy Jones, a Caltech research associate. The 4.7-magnitude earthquake was felt as far as San Diego and north into the coast of Bakersfield. Ten aftershocks were recorded within two hours of the initial event, though only one was above a magnitude 3.

Someone on Eric Pierson's FB posted a Surf Punks song, "Kanan is Doomed! "

But 4 days later:

https://telegraph247.com/news/**three-more-small-earthquakes**-shake-los-angeles-north-of-malibu/ September 16, 2024 first quake, a magnitude 3.76 temblor, was reported at 4:22 a.m. about a mile north of Malibu, just west of Kanan Dume Road, according to the U.S. Geological Survey.

Mr. Richard E. Weintraub

[redacted]

Malibu, CA 90264

Hello Richard,

We are the property owners at [redacted] and [redacted] Malibu Rd (Bayshore Drive) that have participated in the re-construction and sealing of the common driveway that runs from the bottom at Malibu Road to the top at 25253. We, jointly, would like to offer support of your proposed project above our properties.

As you are well aware, our neighborhood has had significant drainage and geological issues. We feel that the row of Caissons and soldier piles with the new project will significantly increase the stability of our neighborhood. This is obviously a tremendous benefit for us and for Pacific Coast Highway as well.

Another benefit is the project, as proposed, is currently one story. That helps reduce perspective from both Pacific Coast Highway and Bayshore Drive.

Thank you for your consideration.

Date Received 12/16/25 Time 12:57 p.m.
Planning Commission meeting of 12/16/25
Agenda Item No. 5C
Total No. of Pages 3

December 16, 2025

Subject: GEOTECHNICAL FINDINGS AND REQUEST FOR ADDITIONAL STUDY COASTAL DEVELOPMENT PERMIT NO. 19-012, CERTIFICATE OF COMPLIANCE NO. 21-004, LOT MERGER NO. 24-002, 25200 Pacific Coast Highway, APNs 4459-013-021 & 4459-014-018

We have serious reservations concerning slope stability with the water generated by the project proposed at 25200 Pacific Coast Highway, introduced into the adjacent hillside properties. A supplemental technical letter response prepared by Pacific Coast Land Consulting (PCLC), responding to Feffer Geological Consulting's August 20, 2025 response for the proposed development at 25200 Pacific Coast Highway. We are worried by the threat of the hill destabilizing and failing onto adjacent properties after introducing water and soil disturbance to a known Assessment District 98-3 Malibu Road. These are questions of life safety and property loss.

Long time residents remember the house next to 25325 Malibu Road completely washed away in a heavy rain, the large lot next to 25325 sank nearly ten feet. We do not want what happened in the Rappaport slide (25040 PCH) to happen to residents where the soil headed towards the houses. We heard that houses had the landslide mud and soil went into the inside of homes.

The original stabilization piles for 25200 PCH were on the slope but were moved to avoid a variance. It may be that stabilization piles (subject to easements) are required on the entire slope to support this expansive house and the water it is introducing into the soil. Please consider the life safety and loss of property of those below the slope. In other slides like **Big Rock, mere additions of bedrooms and bathrooms are prohibited because such new development alone may affect the slide below.**

- Malibu LIP § 9.3(A)(1) — requires that a project *"will neither be subject to nor increase instability of the site or structural integrity from geologic hazards due to project design, location, or other reasons."* And must consider "worst case" analysis per Malibu LIP § 9.3(D), and omitting specific data such as SI 5 and SI 6 does not achieve "worst case analysis". This finding is not backed up when landslide geometry and off-site impacts remain unresolved per PCLC's technical review.
- Malibu LIP § 9.4(A) — requires the consulting geologist or geotechnical engineer to certify that the proposed development *"will in no way contribute to instability on or off the subject site,"* including adjacent and downslope properties. Feffer's analysis for the project is limited to the project site and does not substantiate off-site stability and in fact acknowledges (Dec 17, 2019) that "**calculated failures occurred predominately <u>offsite on the property below</u>**", "All calculated **<u>seismic failures occurred offsite</u> and below the property line** " and indicating that**" <u>the site itself would remain grossly stable, even if the offsite portion of the slope were to fail away during a seismic event</u>."** (Feffer's Dec 17, 2019 report page 7.) A consultant cannot simultaneously acknowledge adjacent off-site failure and certify that the project "will in no way contribute to instability on or off the subject site." PCLC further recommends that the geometry using all data available must be utilized without leaving out datapoints that includes the introduction of water to the site and define limitations on water use in a known slide zone. The project must substantiate how the water is kept from destabilizing the slope with putting water into the toe of the slide. The Big Rock settlement included that the houses are not able to add bedrooms or restrooms for impact to the slide. The City is not able to make the findings required by LIP chapter 9 based on the current record.

- Malibu LIP § 9.4(D) — requires development in hazardous areas to be designed to ensure *long-term stability over the economic life of the development [100 years]*.
  Analyses limited to short-term or static conditions do not satisfy this requirement. The City is not able to make this finding based on the current record.

- Malibu LIP § 10.4 — requires that new development on oceanfront bluffs be sited outside areas subject to geologic hazards over a *minimum 100-year economic life*.
  The unresolved landslide geometry and groundwater conditions prevent this determination. The City is not able to make this finding based on the current record.

Accordingly, the proposed LIP findings and certifications are unsupported.

In addition, where parcels are legalized through a Conditional Certificate of Compliance No. 21-004, the State Subdivision Map Act (Government Code, § 66499.35) requires that conditions necessary to protect public health, safety, and adjacent properties be imposed. In a geologically sensitive area such as Malibu Road, those conditions necessarily require an understanding of downslope geology, groundwater conditions, and potential off-site impacts. Absent site-specific evaluation of adjoining properties, approval of proposed Lot Merger No. 24-002 is premature.

Upon reviewing the Staff Report, we object to reliance on outdated, inconsistent, and/or superseded information that does not accurately depict the current state of the project. Documentation in the Staff Report, including site plans, and other documentation are outdated or internally inconsistent; for example, the architectural site plan omits two stabilization piles shown in Feffer Geological Consulting's design, among other inconsistencies. We believe that all information in the Staff Report should be updated to reflect current conditions, and revised analyses, and current documentation rather than old/inconsistent information. Furthermore, the City should update inclinometer data to include all data in lieu of wiping out previous data and to show both Fugro and Ye Assessment inclinometer data on one graph.

We respectfully submit that additional geotechnical study is required, including installation of new inclinometers; monitoring through at least one wet season (think of increasingly more powerful atmospheric rivers climate change is bringing to the coast); recalculation of landslide geometry and failure surfaces to incorporate all available data; and evaluation of off-site conditions affecting adjacent and downslope properties, all as mandated by the Malibu LIP. We ask for further clarification and substantiation to feel comfortable with introducing water into the soil of the Assessment District 98-3 Malibu Road. In addition the new house would block path of travel in an emergency over this hill for those on foot. Please do not let the soil and mud come down to the residents' houses for the sake of life safety and protection of property.

Thank you for your consideration.

Respectfully submitted,

Concerned Citizens of Malibu Road

This finding is not backed up when landslide geometry and off-site impacts remain unresolved per PCLC's technical review.
- Malibu LIP § 9.4(A) — requires the consulting geologist or geotechnical engineer to certify that the proposed development *"will in no way contribute to instability on or off the subject site,"* including adjacent and downslope properties. Feffer's analysis for the project is limited to the project site and does not substantiate off-site stability and in fact acknowledges (Dec 17, 2019) that "**calculated failures occurred predominately <u>offsite on the property below</u>**", "All calculated **<u>seismic failures occurred offsite</u> and below the property line** " and indicating that**" <u>the site itself would remain grossly stable, even if the offsite portion of the slope were to fail away during a seismic event</u>."** (Feffer's Dec 17, 2019 report page 7.) A consultant cannot simultaneously acknowledge adjacent off-site failure and certify that the project "will in no way contribute to instability on or off the subject site." PCLC further recommends that the geometry using all data available must be utilized without leaving out datapoints that includes the introduction of water to the site and define limitations on water use in a known slide zone. The project must substantiate how the water is kept from destabilizing the slope with putting water into the toe of the slide. The Big Rock settlement included that the houses are not able to add bedrooms or restrooms for impact to the slide. The City is not able to make the findings required by LIP chapter 9 based on the current record.

- Malibu LIP § 9.4(D) — requires development in hazardous areas to be designed to ensure *long-term stability over the economic life of the development [100 years]*.
  Analyses limited to short-term or static conditions do not satisfy this requirement. The City is not able to make this finding based on the current record.

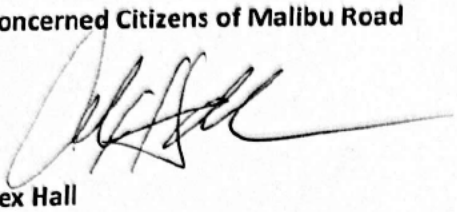
- Malibu LIP § 10.4 — requires that new development on oceanfront bluffs be sited outside areas subject to geologic hazards over a *minimum 100-year economic life*.
  The unresolved landslide geometry and groundwater conditions prevent this determination. The City is not able to make this finding based on the current record.

Accordingly, the proposed LIP findings and certifications are unsupported.

In addition, where parcels are legalized through a Conditional Certificate of Compliance No. 21-004, the State Subdivision Map Act (Government Code, § 66499.35) requires that conditions necessary to protect public health, safety, and adjacent properties be imposed. In a geologically sensitive area such as Malibu Road, those conditions necessarily require an understanding of downslope geology, groundwater conditions, and potential off-site impacts. Absent site-specific evaluation of adjoining properties, approval of proposed Lot Merger No. 24-002 is premature.

Upon reviewing the Staff Report, we object to reliance on outdated, inconsistent, and/or superseded information that does not accurately depict the current state of the project. Documentation in the Staff Report, including site plans, and other documentation are outdated or internally inconsistent; for example, the architectural site plan omits two stabilization piles shown in Feffer Geological Consulting's design, among other inconsistencies. We believe that all information in the Staff Report should be updated to reflect current conditions, and revised analyses, and current documentation rather than old/inconsistent information. Furthermore, the City should update inclinometer data to include all data in lieu of wiping out previous data and to show both Fugro and Ye Assessment inclinometer data on one graph.

We respectfully submit that additional geotechnical study is required, including installation of new inclinometers; monitoring through at least one wet season (think of increasingly more powerful atmospheric rivers climate change is bringing to the coast); recalculation of landslide geometry and failure surfaces to incorporate all available data; and evaluation of off-site conditions affecting adjacent and downslope properties, all as mandated by the Malibu LIP. We ask for further clarification and substantiation to feel comfortable with introducing water into the soil of the Assessment District 98-3 Malibu Road. In addition the new house would block path of travel in an emergency over this hill for those on foot. Please do not let the soil and mud come down to the residents' houses for the sake of life safety and protection of property.



Thank you for your consideration.

Respectfully submitted,

Subject: RE: REMAINING UNADDRESSED ITEMS – REVIEW OF FEFFER GEOTECHNICAL REPORT
Project: 25200 Pacific Coast Highway, Malibu, California

1.0 INTRODUCTION

We have reviewed Feffer Geological Consulting's response titled "RESPONSE TO CITY OF MALIBU GEOTECHNICAL REVIEW COMMENTS," dated August 20, 2025, which was prepared in reply to concerns raised in Pacific Coast Land Consulting's original technical letter (Pacific Coast Land Consulting, PRELIMIARY REVIEW OF FEFFER REPORT AUGUST 15, 2025) authored previously. While the August 20, 2025 response summarizes selected data and provides additional narrative discussion, it does not address all of the technical concerns identified in the original PCLC letter, and several critical issues remain unresolved or only partially addressed.

These unresolved issues are fundamental to accurately characterizing site conditions, evaluating landslide hazards, and designing a stabilization system. Because the proposed development is located upslope of existing residences along Malibu Road, any remaining uncertainty regarding slope stability or groundwater conditions has the potential to adversely affect off-site properties. Accordingly, this letter provides clarification of the outstanding concerns that were not fully addressed in Feffer's August 20, 2025 response and explains why additional evaluation is warranted.

Geologic investigations are often challenging, it is rare situation where a site exists with so much data to evaluate and use as part of the investigation. As Mr. Feffer knows investigation on this

site go back into the 1960s, There have been numerous landslide events in this area. Enough so that lead to the establishment of the Malibu landslide Assessment District.

Malibu has an inordinate number of landslides, all of which are quite complex due the geologic conditions. These include Big Rock Mesa, Eagle Pass-Las Flores, Latigo Bay Villas and numerous others. All of these slides have at least one thing in common and that is the failure to build a correct and accurate geologic model for analysis. The issue here is not that this development should be built but that it needs to be built using the correct model. The residents below this proposed development are very concerned that the proposed work will have a negative impact on their homes. Their concerns are valid, for the reasons previously presented. Mr. Feffer's response only adds additional concern to the residents by not considering the geological questions previously presented.

2.0 REGULATORY AND PROFESSIONAL OBLIGATIONS

Further, the introduction of deep stabilization elements such as piles or caissons on the upper parcel may increase risk to downslope properties if slide geometry, depth, or continuity are not correctly defined. Partial stabilization of an upper portion of a landslide mass can create a false sense of stability, while transferring stresses to deeper or downslope portions of the slide mass that have not been analyzed. If deeper or secondary slide surfaces exist below the embedment depth of the piles, the added rigidity and disturbance associated with pile installation may redirect or concentrate movement downslope rather than arrest it.

Temporary construction effects also warrant consideration. Drilling disturbance, spoils handling, vibration, and short-term groundwater changes associated with pile installation were not evaluated, yet may be critical in an area with a history of slow landslide movement.

Analyses focused primarily on short-term or static factors of safety do not address the potential for long-term creep or progressive deformation, which is consistent with the documented inclinometer history at this site and must be evaluated over the projected economic life of development.

Additionally, any adverse consequence of a mischaracterized geologic or stability model would be asymmetrically borne by downslope properties, where even small increases in movement or groundwater pressure could result in structural damage or loss, as demonstrated by historic

landslide failures in this area. These considerations further underscore the necessity of fully evaluating off-site conditions before the required stability findings can be made.

3.0 STANDARD OF CARE FOR LANDSLIDE INVESTIGATION

The proper procedure for investigating any site is to gather all data and utilize it in a comprehensive analysis. This means paying attention to all data and not picking and choosing favorable data points while ignoring less favorable data. Neither I nor Mr. Feffer were present for any of the earlier work. We have to accept the observations and geologic data as they are presented in the logs. This means relying on observations locations depths orientations and descriptions.

Typically, it takes 3 things to confirm the presence of sliding ancient or active (with instrumentation).

1) Geomorphic evidence – the shape of landform, offset in stream beds, hummocky terrain etc. Landforms are often altered with time, as erosion occurs and man modifies the terrain, The result of this is obscure some features such as boundaries, stream beds and alignments.
2) Subsurface investigation- Borings are drilled and geologists go down into the borings and record their observations and collect data such as geologic attitudes on bedding, fractures clay seams and slide planes.

   Protocol for logging is to identify every single vertical inch of the column of rock exposed in the boring. Thus, logs are created with lines drawn to show where one lithology with a particular characteristic end and another begins. Stone logs from 1962 did this and Feffer's logs did not, neither did Cy logs.

   This data is then prepared in log format for others to review and analyze. One of the important observation a geologist makes while down hole is to note the character of the earth material. Words like smashed up, (a colloquial term) fractured pulverized re-worked

etc. are used to denote bedrock materials that have been disturbed by movement, usually landslide activation.

Often a geologist will identify a slide plane. These features can be very thin. 1/16" or less to several inches in thickness. Term like polished surfaces with striation surface, basal surface, slide or glide plane (glide is colloquial and not used much anymore but the descriptive nature of the word and meaning is clear: **movement along a discrete plane** .

Other terms in observations made by a. geologist when down hole include. Striations and slicks. These are synonyms, Striation or slicks (short for slickensides are. fine scratches or grooves cut into rock opposing rock faces as one block moves past another. This can be caused by faulting internal shifting of major blocks. But is most often associated with landslide movement and is often the signature of a landslide.

3) Instrumentation- The main instrument in analyzing a landslide are inclinometers. These are indexed pipes put into suspected active landslide and then monitored by comparing an initial or base reading to subsequent readings. The accuracy of this system is typically .1" over a length of 100'. Thus, repeatable movements however small mean that this is an active slide. Instrumentation is typically what you see is what is there type of data point. The only exception to this is by changing the initial reading. This resets the vertical baseline reading back to a straight line and eliminates evidence of previous movement.

4) Once the data is collected and assembled on map the next step is develop a structure contour map of a surface defined by an accumulation of all the datapoints, logs and instrumentation. This is done by plotting the elevation of the surface of interest at a particular location boring or inclinometer. It is done for all the borings and inclinometers. If this results in a chaotic mess where elevations **don't** project from one boring to another or a point on an inclinometer then it is likely that the feature investigated is not a slide, has other origins. Contrarily, if the data points do line up on an evaluation basis and spatial basis a map of slide plane has been created that relies on all data. This is called a

structure contour map. It is the standard of care in developing a model to be analyzed with slope stability programs. The detail and continual logging notes for the boring must be complete and detailed enough to complete this critical. Task. Feffer's work did not accomplish this.

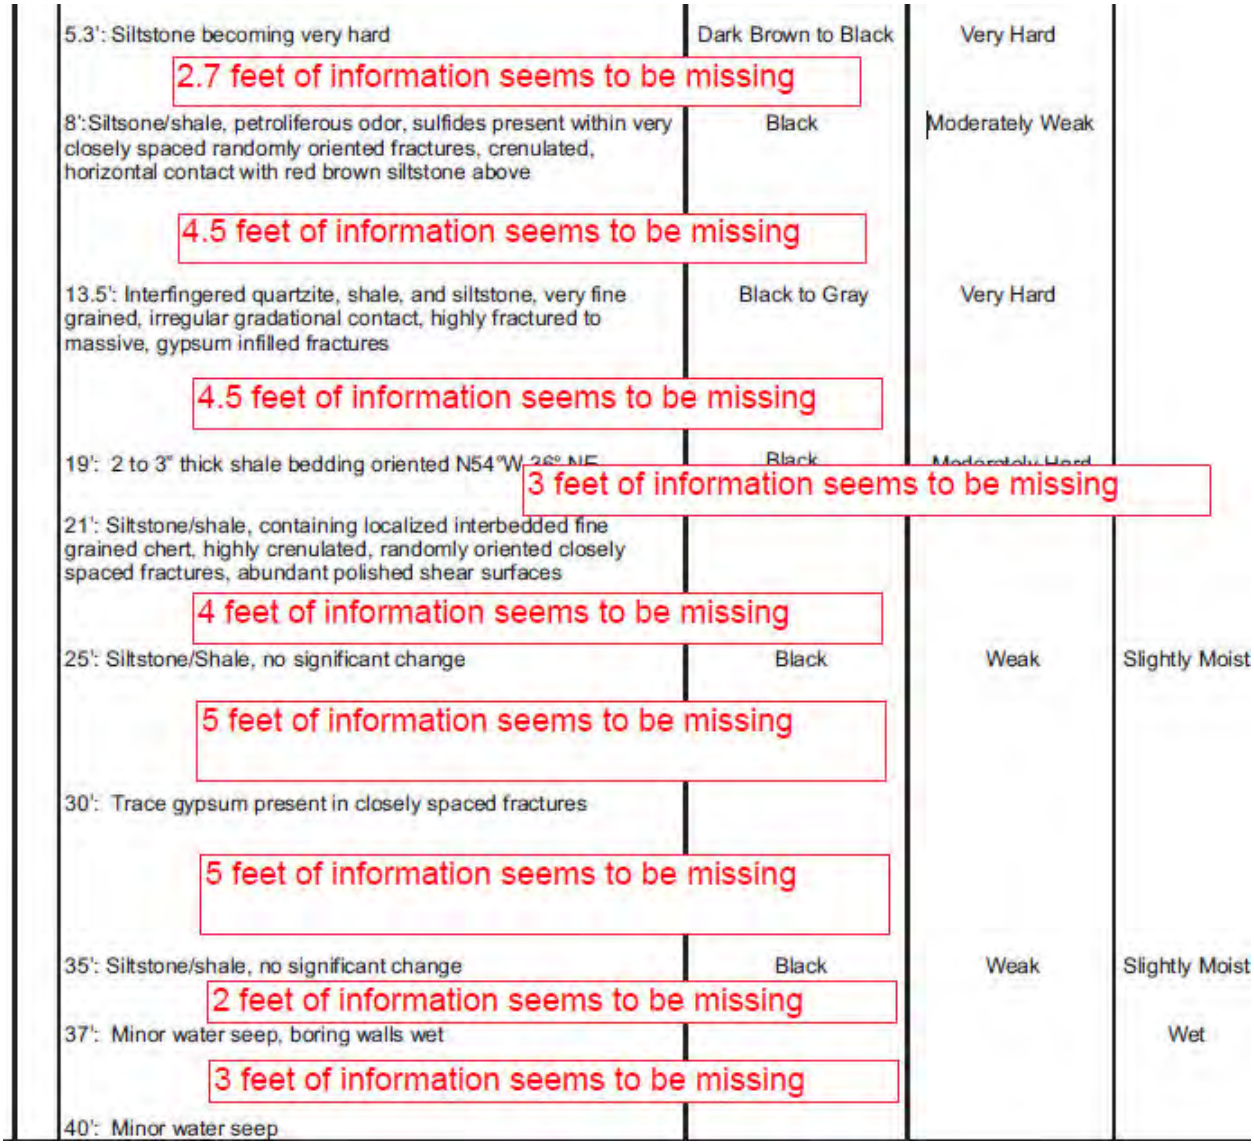
5) Groundwater Modeling. The ground water table needs to be established with potential high levels to be used in the slope stability analysis.

3.1 GEOMORPHIC EVIDENCE

Surface features such as hummocky terrain, disrupted drainage, and slope breaks often indicate past or ongoing landslide activity. Although erosion and grading can obscure these features over time, their partial removal does not negate their original significance.

3.2 SUBSURFACE INVESTIGATION

The concerns regarding the characterization of subsurface materials in Feffer's borings remain unaddressed. Specifically:



- Older consultants' reports documented crushed, disturbed, or sheared materials consistent with landslide deposits, while Feffer logs classify similar intervals as "bedrock" without explanation.
- Gaps in log descriptions at depth and a lack of detailed material characterization were not addressed and did not meet the industry standard of care.
- No explanation was provided for discrepancies between historic logs and Feffer's own interpretation.

As stated in the prior technical letter, continuous subsurface investigation is critical to defining landslide geometry and failure mechanisms. Continuous boring logs are essential. Industry standards require logging every vertical inch of the borehole and documenting lithology changes, shear zones, bedding attitudes, fractures, clay seams, and disturbed materials. Terms such as *smashed*, *jumbled*, *pulverized*, *reworked*, *slickensides*, and *polished shear surfaces* are commonly used to describe materials disturbed by landslide movement.

Historic logs prepared by STONE SUBSURFACE EXPLORATION LOGS, MALIBU ROAD AREA, MALIBU, CALIFORNIA. 1962. meet this standard. By contrast, Feffer's logs—and earlier CY logs—contain gaps and reduced descriptive detail, limiting their usefulness in defining slide geometry and does not meet the standard of care for geotechnical engineering. Feffer log **B-3** was only intermittently logged with notations every 5' that only denoted fracturing and gypsum in filled cracking (evidence of dilation - movement) A zone of interest, that would correlate with SG 6 and 7 would be from 25'-45' but there were not continuous observations

Feffer log **B-5** reads like landslide however the category description has been described as bedrock. The bedding orientations are southwards towards the beach. However, there are multiple gaps in the logs and the log appears biased towards a non-slide condition despite containing observations of shearing and clays tilted towards the south. The boring is well into the pad area and was previously identified as a slide.

3.3 INSTRUMENTATION AND SYSTEM RESET

The analysis of any slide is only as good as the model developed. And this. means that all data must be considered, for what it is and not subject to interpretation. Feffer's statement that both SI-5 and SI 6 conclude that no "significant movement" is wrong. If Feffer had taken a careful look at all the data in these 2 inclinometers he would have discovered that the appearance of no movement results from a change in the date of the base line readings. Inclinometers operate on a comparison basis. Subsequent readings are then recorded to that initial base line, and the resultant plot shows the depth and magnitude of the offset.

In this situation for SI-5 the initial reading was taken on 8-17-2004. This is the base line reading to which all future readings are to be compared. However, this was not used until the report of 2018-2019 by Fugro in the plots and it is at that time the offsets in SI-5 are clearly visible.

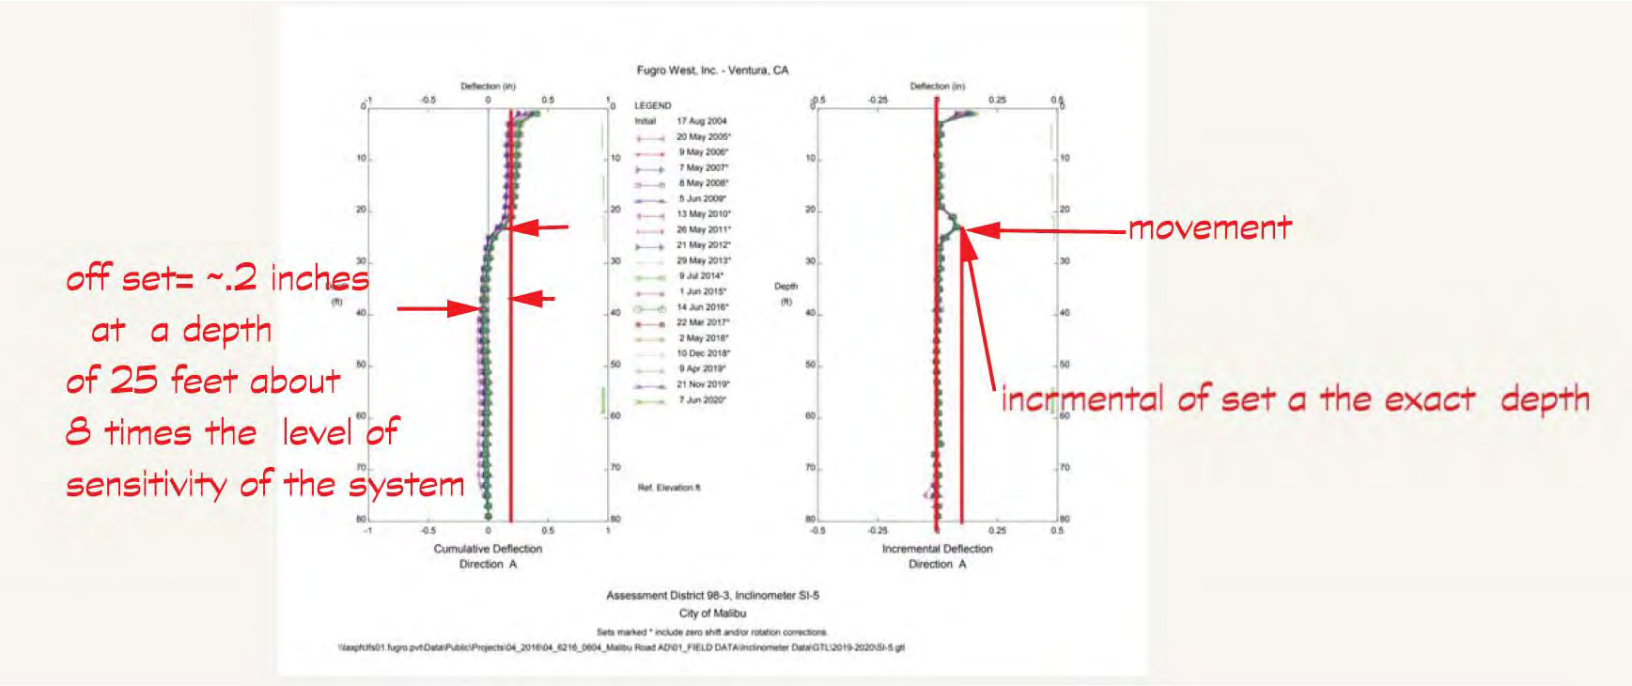
The rest of the readings arbitrarily use a later base line reading in this case the other "initial reading" were on May of 2005. This has the effect of straightening out the plots by eliminating readings between 2004 and 2005.
For SI-6 the earliest identifiable movement occurs at a depth of 38 feet in the 2008-09 report from Fugro.
Incremental displacements are continuously recorded in almost all Fugro report despite initial reading date being changed during plotting. Cumulative displacements plot as much as .2 inches as recently as June 2020.

What is meant by significant movement? How much movement is insignificant? The answer lies in the plots of the inclinometers. If it was, just one inclinometer that had some reading would be suspicious but to have 2 inclinometers show similar results over years of monitoring indicates that slow slide movement is continuing.
Therefore, this data. must be accounted for in the landslide and slope stability model. It wasn't even considered in more than a cursory brush over.

It has now been established that there exist in the body of data significant and numerous points representing the slide plane. The next step is to develop the structure contour and this is as simple as connecting the data points on the slide. If this can be done and it has then the slide is much larger than Feffer's analysis.

It is not the standard of care to just simply connect the dots. This approach leads to an inaccurate and incomplete analysis of the geometry of the slide. If the geometry of the slide is not accurate then subsequent engineering and slope stability, is based upon an inaccurate model and also incorrect.

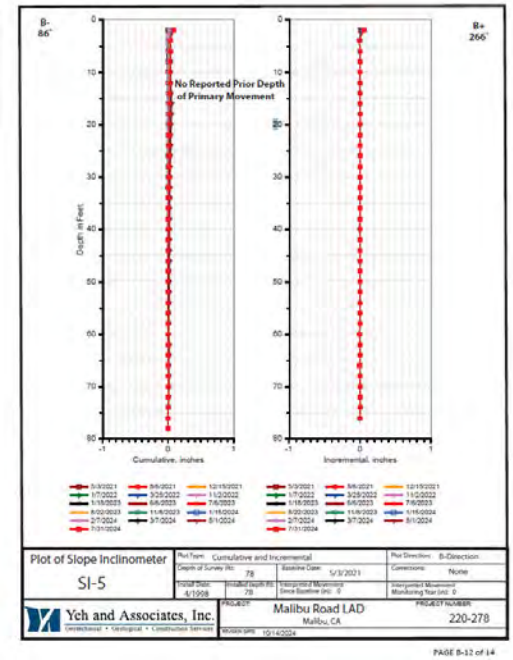
These issues affect the reliability of the geologic model and the validity of later engineering analyses.



Feffer should address:

- Why are Feffer's own logs significantly less detailed than prior logs
- Feffer's logs contain "gaps in the observations"
- Feffer may have misclassified smashed, jumbled, crushed/chaotic materials as "bedrock"
- Feffer ignores identifications of slide surfaces
- Feffer's inclinometer analysis seems to have only consisted of reading the annual report and parroting that language
- In the section reviewed some groundwater profile have a vertical drop. There does not seem to be clear explanation of this phenomenon or what data was used to develop the profile.in one section it appears based on faulting but in other sections the water appears continuous. The review of the logs by CY (boring 2) does not show a fault, and it is shown on the section. It is unclear how this interpretation was achieved. Nor does it demonstrate a significant enough gouge zone to act as ground water barrier. The notation of a healed fault plane. @ 10' in Feffers boring B-2 has only a 31degree easterly dip with a north south strike (parallel to the section) which is at 90 degrees to the fault shown in section 2. No other faulting is found in the logs and it is not placed on the geologic map. The evidence for this. feature is questionable and needs additional supporting data.
- Without this data then the ground water table needs to be a continuous profile from the upper pad to the lower portions of the area. The ground water surface should be

subparallel to the slope of the land consequently is substantially higher, than that which was analyzed.



Inclinometers provide direct evidence of subsurface deformation. Movements as small as 0.1 inch over 100 feet are meaningful. Resetting baseline readings eliminates evidence of prior displacement and must be explicitly accounted for when interpreting results. The City should have Ye and Associates update the data to show cumulative data from the Fugro reports as this creates misleading design data by wiping out past data with a system reset and defeats the purpose of tracking this data.

Fugro 2019-202 dated August 2020 report (Fugro Consultants, Inc. ANNUAL REPORT JULY 2019 THROUGH 2020 MALIBU ROAD LANDSLIDE ASSESSMENT DISTRICT, MALIBU CA. August 2020, pg 48 of pdf) shows cumulative movement:

System reset wipes out previous data:

Yeh & Associates, Inc 2023-2024 Report dated March 20, 2025 (Ye & Associates Inc**.** FY23/24 MAINTENANCE AND MONITORING AD98-3, MALIBU ROAD CITY OF MALIBU, CALIFORNIA. March 20, 2025, Page B-11 of 14, Page 39 of pdf)

3.4 DEVELOPMENT OF A STRUCTURE CONTOUR MAP AND CITY OF MALIBU ASSESSMENT DISTRICT NO.98-3 MALIBU ROAD AND ASSESSMENT FEES

Once subsurface data are compiled, elevations of suspected slide planes must be plotted and evaluated spatially to determine whether a coherent failure surface exists. If data points correlate spatially and geometrically, a landslide surface has been defined. This step is fundamental and cannot be bypassed. Once this structure map is recalculated with all available data and additional data as recommended, 25200 PCH would likely be in the City of Malibu Assessment District No.98-3 Malibu Road and would be pay fees associated with being in the City of Malibu Assessment District No.98-3 Malibu Road.

3.5 GROUNDWATER MODELING

Slope stability analyses must incorporate realistic high-groundwater conditions, particularly where onsite wastewater disposal is proposed. Groundwater surfaces should generally be subparallel to topography unless well-supported geologic barriers are demonstrated.

4.0 INCOMPLETE OR NON-SPECIFIC LOGGING IN FEFFER BORINGS

Concerns regarding Feffer's subsurface characterization remain unresolved:

- Materials described by earlier consultants as crushed, sheared, or landslide debris are frequently classified by Feffer as "bedrock" without explanation.
- Numerous gaps in logging occur at critical depths.
- Discrepancies between historic logs and Feffer's interpretations are not reconciled.

Stone's SG-6 and SG-7 (STONE SUBSURFACE EXPLORATION LOGS, MALIBU ROAD AREA, MALIBU, CALIFORNIA. 1962), located within feet of Feffer borings, describe smashed, jumbled materials with slickensides between approximately 5 and 42 feet, indicative of landsliding beneath the central building pad. Feffer's nearby borings do not reflect these conditions, despite spatial proximity.

5.0 INCLINOMETER DATA INTERPRETATION

Feffer's response relies on the statement that the inclinometer reports indicate "no significant movement." This phrasing requires clarification in the context of the full inclinometer record. While Feffer cites the City's 2025 Assessment District Report. He merely restates the conclusion without doing any analysis. Feffer's response does not address:

- Why earlier inclinometer interpretations identified movement at 32–39 feet
- Records of data. recording goes back as far as 1989, yet no plots of this data was available or apparently reviewed
- Whether instrument noise, calibration, or reading intervals were evaluated
- Whether incremental and cumulative plots were reviewed in any detail
- Was any effort made to obtain the original data and plot the results independently standardizing the use of the initial readings to the earliest available data.
- There appears that pre 2004 inclinometer readings were taken, however no effort to obtain and review this data was made
- Whether deeper movement potential should be reexamined given historic slide mapping

These discrepancies should be resolved through direct comparison of data sets.

a. Later Assessment District reports (roughly mid-2010s onward)

These reports — especially those Feffer references — commonly state variations of:

- "No significant movement"

- "No shear-type movement"
- "Movement within instrument accuracy"

Important nuance:

- These statements are made after baseline resets, which is significant because a system-wide reset effectively re-zeroed the inclinometer profiles; the fact that all inclinometers were set to zero must be considered when interpreting subsequent plots
- They are typically referring to shear-type movement across a single, discrete plane
- They often do not deny incremental or cumulative displacement

Accordingly, when Feffer states that "the inclinometer reports say there is no significant movement," he is accurately quoting some report conclusions, but only in a narrow, technical sense.

b. Earlier reports (and raw plots within later reports)

Earlier Fugro reports — and the plots themselves even in later reports — show:

- Documented incremental displacement
- Cumulative movement on the order of approximately 0.1 to 0.2 inches
- Recurrent displacement at similar depths in:
    - SI-5
    - SI-6

In several reports (including Fugro's INCLINOMETER MONITORING REPORTS, CITY OF MALIBU ASSESSMENT DISTRICT NO. 98-3, MALIBU ROAD, MALIBU, CALIFORNIA. 2008–2009 and subsequent years):

- Movement is explicitly plotted
- The issue is how it is characterized, not whether it exists

These reports do not state that there is "no movement." Rather, they describe movement as:

- slow,
- incremental, or
- below a threshold the consultant defines as "significant."

c. What "no significant movement" actually means (technically)

In inclinometer practice:

- "Significant" is not a regulated term
- It is consultant-defined

It usually means:

- no abrupt shear plane,
- no accelerating displacement, or
- no emergency condition

It does not mean:

- no deformation,
- no landslide-related movement, or
- no relevance to long-term stability

Accordingly, Feffer's statement is technically incomplete, even if not outright false.

d. Assessment District (AD) data is for monitoring, not design

Assessment District (AD) reports are meant to:

- track long-term trends,
- support maintenance decisions,
- and observe known landslide behavior

AD data is not intended to:

- define landslide geometry,
- establish failure mechanisms, or
- justify new development without independent, site-specific geologic modeling

Reliance on AD summary language misapplies the purpose of those reports.

6. GROUNDWATER UNCERTAINTY

Groundwater profiles used in Feffer's analyses do not represent the highest reasonably anticipated conditions, particularly given the proposed onsite wastewater system. Absent clear evidence of a laterally continuous groundwater barrier, groundwater should be assumed to form a continuous, slope-parallel surface.

It is well established from the history of landsliding in the Malibu Road area that the introduction or increase of water within a landslide mass can be a primary triggering mechanism, and under adverse conditions can prove devastating. Residents along Malibu Road recall that, around 1978, a residence located at 25325 Pacific Coast Hwy was lost during landslide activity and a substantial section of Malibu Road reportedly subsided on the order of approximately ten feet, a condition that remains evident today. These events occurred within living memory and underscore the sensitivity of the landslide complex to groundwater conditions.

Given this history, any increase in groundwater—whether from rainfall, altered drainage, or onsite wastewater disposal—must be conservatively evaluated with respect to both on-site and downslope stability.

7. MISSING PACIFIC SOILS DATA

Our report noted that Pacific Soils previously identified landslide terrain, although their logs are unavailable. Feffer's response did not address:

- What effort was made to find these logs?
- How missing data was considered in Feffer's uncertainty analysis
- Why earlier conclusions regarding landsliding were not incorporated conservatively given the lack of confirmatory logs
- Whether additional subsurface exploration is warranted to resolve this documented data gap

This omission leaves an unresolved question regarding the completeness of the site characterization.

Feffer should address if data is missing, make every effort to find these logs, whether there could be an underestimate of the likelihood of landsliding.

8. LANDSLIDE GEOMETRY IMPLICATIONS AND FAILURE SURFACE DEFINITION

As discussed above, the definition of landslide geometry presented by Feffer relies on incomplete subsurface data and selective use of instrumentation. When combined with missing or non-continuously logged boring information and the selective omission of inclinometer data from SI-5 and SI-6, the interpreted slide plane is artificially shallow.

Based on the geometry shown in Feffer's analyses, the slide surface is depicted as terminating above the depths at which movement has been documented in SI-5 and SI-6. However, if the documented displacement depths from SI-5 and SI-6 are incorporated into the geologic model, the slide plane necessarily projects significantly deeper and extends beneath the proposed project site.

Accordingly, omission of SI-5 and SI-6 from the geometric model, together with incomplete boring logs, results in an underestimation of slide depth, extent, and continuity. This materially affects slope stability calculations, pile embedment assumptions, and conclusions regarding both on-site and off-site stability.

9.0 DISMISSAL OF OLDER LANDSLIDE CONCLUSIONS WITHOUT TECHNICAL BASIS

Feffer's letter asserts that earlier consultants relied heavily on aerial photographs, but does not address:

- Aerial photos are but 1 form of data that is useful. This type of data. is very subjective as it relies, heavily on the professionals' view the photos. It is however, only a first cursory step and should not under any circumstance be used as tool in the definition of the subsurface geometry.
- Why multiple independent consultants identified similar landslide features over several decades
- Why the conservative interpretations contained in prior reports were not incorporated into the current model as stated in older reports.
- How Feffer's interpretation differs mechanically from older mapped configurations

As a result, Feffer's response does not adequately justify the departure from historical conclusions.

10.0 SHEAR STRENGTH SELECTION AND UNUSED LOWER RESIDUAL VALUES

Although Feffer outlines the basis of the shear strengths used, Feffer did not address:

- If the geometry is wrong, then any back calculated values will also be wrong

- The concern that strength values were averaged across borings, potentially obscuring weaker intervals
- Why the lowest residual value (8.5°), included in Feffer's own data set, was not used in translational analyses
- Whether user-defined failure planes—consistent with historic slide mapping—were evaluated with appropriate residual strengths

These items remain unresolved and directly affect factor-of-safety outcomes.

11.0 NEED FOR ADDITIONAL INSTRUMENTATION

Feffer's response does not address the recommendation for:

- A new inclinometer on the upper pad
- Monitoring through at least one wet winter to capture potential delayed movement

This recommendation remains outstanding and is consistent with CBC 1704A monitoring requirements for slope stability concerns.

Feffer's letter says only that the existing data shows no movement, but does not address:

- Why new instruments are or are not warranted
- Whether seasonal monitoring could reveal movement not previously captured

12.0 CY & ASSOCIATES' GEOLOGIC MISCHARACTERIZATION

Our report noted that CY & Associates did not correctly identify site geology. Feffer's response references CY's lack of landslide evidence but does not explain:

- Whether their geologic mischaracterization was corrected
- Whether Feffer's interpretation relied on or contradicted CY's assumptions

This point remains unaddressed.

13.0 LACK OF ANALYSIS OF COMPLEX SLIDE GEOMETRY

Feffer's response references both circular and translational analyses, but does not address:

- The absence of modeled compound or multi-surface failure configurations
- The reviewer's request for user-specified failure geometries based on mapped geologic features

- Why deeper bedding-controlled surfaces suggested by previous investigations were not analyzed
- Most if not all of Stone sections show landsliding beneath the toe of slope and above the mapped active slide indicating that the slide is continuous through this area. Boring on the upper pad and below the pad shows. evidence of sliding. How is this explained given the depth involved.

This gap remains significant given the site's structural complexity.

14.0 PILE SYSTEM DEPTH AND ABILITY TO RESIST COMPLEX SLIDING

Although Feffer's letter reiterates support for the currently designed pile system, it does not respond to the specific concern that:

- The piles may not extend deep enough to intercept both upper and lower potential slide surfaces
- The design does not address compound or irregular failure geometries
- Revised pile embedment depths and tieback lengths may be required if lower residual strengths or deeper slide surfaces are considered

This remains a key unresolved engineering issue.

15.0 CONCLUSION

The geologic evaluation and the establishment of landslide geometry presented to date remain incomplete and do not adequately define the type, depth, continuity, or extent of landslide movement affecting the site and adjoining downslope properties. As a result, the slope stability analyses and subsequent engineering recommendations are based on an inaccurate or insufficient geological model and therefore cannot be reasonably relied upon. . The homeowners who are affected have good reasons to be concerned about the stability of the ground they are built on. This project represents an opportunity to enhance the stability of the slide complex and the lower homes, as well as providing a stable building site for the proposed development.

Given the potential for very heavy rains and subsequent increase in groundwater, utilizing an onsite wastewater system must be very carefully addressed. The above items represent significant technical questions that were not addressed or fully resolved in Feffer's response. We believe these issues warrant further evaluation, including additional subsurface exploration, review of inclinometer data, reevaluation of shear strengths, and reconsideration of the stabilization system's depth and configuration.

We remain available to discuss these matters and to review any supplemental analyses Feffer may wish to provide.

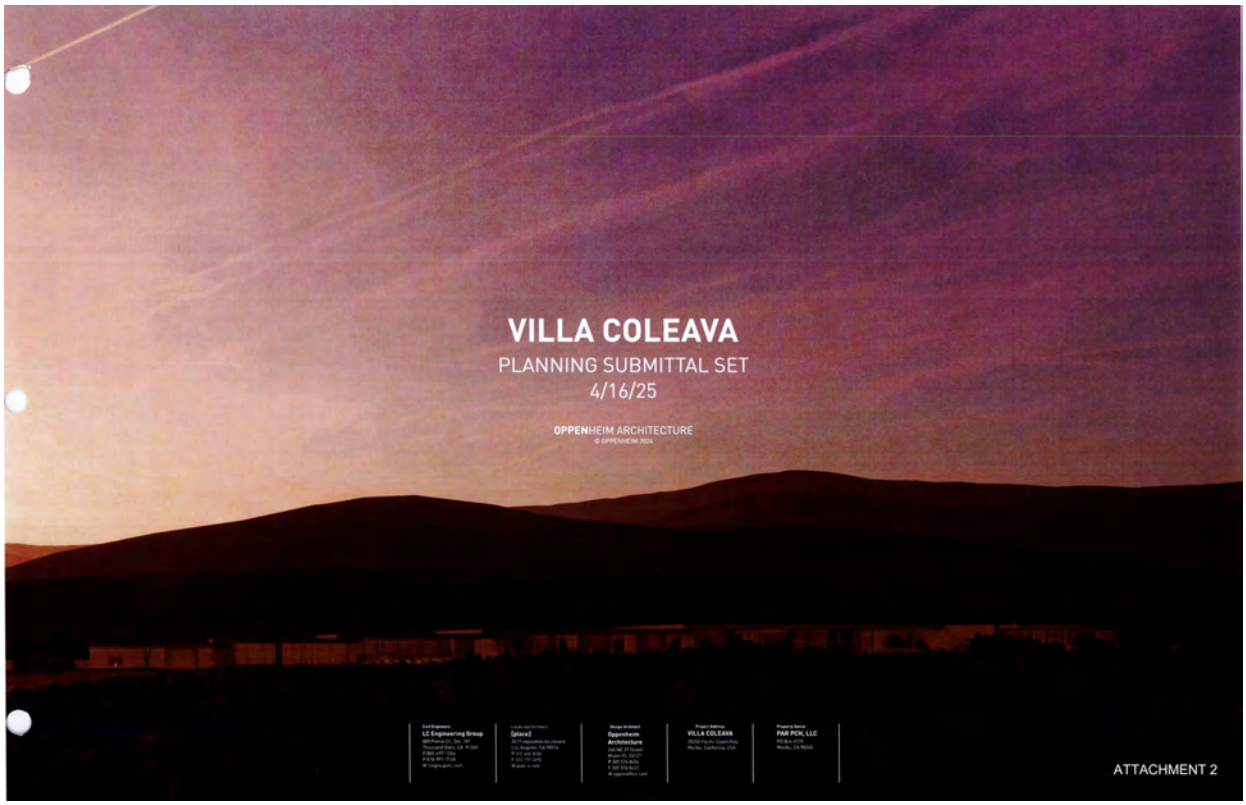
The following is my letter of July 19 to the Planning Commission. I just noticed (I've been sick) that it's not included in the public correspondence.
– K



Hi Commissioners,

I haven't read the staff report closely this time – not to my usual standard – but I did walk the whole site not long before the Palisades Fire, when it appeared the project would be imminently in front of the Commission. I'm qualified to make a few limited observations.

Recently I was driving up the PCH with a friend who knows Malibu well but hadn't been in town for a while. When we got to this site, they saw the story poles and exclaimed,

> "Whoa, they're building a strip mall there?!"
> I said, "It's a house."
> "You mean condos, right?"
> "No, one house."

Therein lies at least one rub. In attempting to spread a house out so thin as to avoid two stories, they've affected the entire view along that area. What makes the blockage of a "visually impressive" view significant is not simply the proportion of ocean or mountains it blocks from a certain spot; a little bit of blockage across that wide span of view can and does affect the entire view. It's hard to hide a really big spec house, no matter how it's shaped. Even the cover sheet of the Planning Submittal (at PDF 52) is a rendering "at dusk," such that the full width of the proposal can scarcely be seen:

(I saw something similar in an ad for the struggling NEOM resort in Saudi Arabia.)

The way it's arrayed on the lot doesn't account for the fact that the public views from PCH feel more significant closer to the west end of the lot, where the beach and Point Dume are more of what you're looking at as you drive west. In effect, the view corridor is on the wrong end of the lot. I understand there are some private views from Puerco Cyn Rd. that would be affected, but all things considered, the public interest is to be preferenced. Anyway, it looks like Puerco houses would see the structure no matter where it is on the lot.

The report doesn't mention that the project would be in full view of the public trails on MRCA land on the other side of PCH, accessed via the Sara Wan trailhead at Corral beach. Tucking the project back further on the East side *might* also help those views.

Evidently in an attempt to sink the structure from view, large retaining walls have been proposed between the structure and PCH. Someone sent me a link to the website for this spec house; it shows an oversize retaining wall on the north side, not part of the building structure. The Wall and Fence Plan A (at PDF 61) show several lines of 12 ft "building walls" in addition to multiple retaining walls of unspec'd height. On that sheet to the left of the vertical "match line" there's an area where four walls are staggered, one above the other. Recall that retaining walls, unless they are integrated in the building, can be a max of two 6ft walls staggered at least 6ft apart. For a building wall, you get one wall of 12 ft max. So that one spot looks like it could be impermissibly stacking as much as (12+12+6+6) 36 ft of wall going up the slope between the structure and PCH.

Beyond that, as others will doubtless point out, this area has geological issues. The setting is right in or adjacent to a known active slide. That makes the over-height walls not only impermissible, but imprudent.

From a land use and traffic perspective, the analysis has not considered the small shopping area proposal that has been developed for the NE corner of PCH and

Agenda Item No. 5C
Total No. of Pages 2

Puerco Cyn. I don't know how active those plans are currently – the developer showed them to me some time before Covid hit – but there could be interactions associated with that intersection to be accounted for (recall that CEQA cares about *potential* impacts too). All traffic to the west from the current project site would first have to turn around at Puerco.

More generally, consider carefully the interactions with freeway-speed PCH traffic there. Those artificially high berms could block sightlines, making egress unsafe – especially because merging onto the PCH you'd be driving uphill, slow to accelerate to traffic speed (even if the owner drives race cars, their tradies will have trucks and panel vans).

Finally, this one feels like one that could get sent up to Council, no matter which way you decide it. So, when there's a debate about some aspect, there's little need to argue; just be sure to get all your thoughts in the record.

Best,
K

Subject: 5C 25000 PCH 12-16-25
Date: Tuesday, December 16, 2025 3:34:26 PM

Commissioners, below are Slow Growth's comments on the above referenced project
.

Honorable Members of the Planning Commission,

Obstruction of Protected View

Over the years little by little, project by project, protected public views along PCH are being blocked by structures and/or by landscaping.

This project's height and its landscaping as currently proposed would block an important and a stunning ocean view from PCH, a designated scenic highway. This view needs to be protected and preserved.

Please do the right thing for Malibu Residents, commuters, and visitors alike who travel this portion of the highway by conditioning this project's development, including but not limited to , structures, retaining walls, fencing, the entrance gate be invisible from PCH.

This can perhaps be done by reducing the height of the structures or it can be accomplished by grading the site elevation low enough to prevent all structures from being seen from PCH.

It is more acceptable for the Commission to grant variances for higher retaining walls and for excessive grading to lower the elevation height of the site to prevent a PCH view obstruction than to allow a permanent view obstruction of the current view from PCH.

Berm

There is no guarantee that the existing Cal Trans berm will be kept in place. Please condition the project to require keeping the existing Cal Trans Berm in place or if over time the berm hasto be removed the property owner will have to replace it with landscaping to be maintained at the height of the existing berm. For if the berm is removed over time for some reason and there is no replacement landscaping the residence will once again be seen from the highway blocking the public view.

Landscaping

CC: Planning Commission, PD,

Recording Secretary, File

Date Received 12/16/25 Time 3:34pm
Planning Commission meeting of 12/16/25
Agenda Item No. 5C
Total No. of Pages 2

Condition *31 states: To minimize bluewater view obstruction from PCH, on-site vegetation, including trees, shall be selected and located to have a maximum growth height at maturity that will not extend above the PCH grade or Caltrans berms, whichever is higher, and be maintained at this height. The Final Landscape Plan submitted for plan check approval shall reflect this requirement.* The existing landscaping plan in the staff packet has vegetation that doesn't comply with this condition and it would be prudent before project approval to require the applicant to submit a new landscaping plan that conforms to this condition for review by the Commission and the public.

Public Views Protected

Let's be clear an applicant is not guaranteed the maximum TDSF or a desired height if public views are obstructed. A project can be denied or modified due to: visual impacts or a public view obstruction.

Findings

The following findings can't be made for the approval of a Coastal Development Permit:

Finding 1. That the project as described in the application and accompanying materials, as modified by any conditions of approval, conforms with the certified City of Malibu Local Coastal Program. Since this project will substantially block the public view, it doesn't meet the LCP requirement and this finding can't be made.

Finding 3. The project is the least environmentally damaging alternative. Our recommendation would be a less damaging alternative.

Conclusion

We respectfully request that the project be denied as designed and redesigned to eliminate the obstruction of public views as seen from PCH by either reducing the height of the structures and/or by granting a variance to allow higher retaining walls and excessive grading to lower the elevation height of the site.

Thank you for considering our comments.

Re: **12-16-2025 Planning Commission of the City of Malibu Meeting (Agenda Item 5C; Project at 25200 Pacific Coast Highway)**

Dear Chair Riddick, Vice Chair Mazza, and Members of the Planning Commission:

Angel Law represents Concerned Citizens of Malibu Road, Inc. concerning the above-referenced agenda item. We write in opposition to the City of Malibu (**City**) Planning Commission's adoption of Resolution No. 25-05, which would approve Coastal Development Permit No. 19-012, Certificate of Compliance No. 21-004, Lot Merger No. 24-002, and the Class 3 categorical exemption from the California Environmental Quality Act (**CEQA**) for PAR PCH, LLC's (**Applicant**) proposed project at 25200 Pacific Coast Highway (**Project**).

Concerned Citizens of Malibu Road is an organization located within the City's Malibu Beach neighborhood that sits directly downslope of the Applicant's blufftop Project. The Applicant is seeking the following entitlements:

- A Coastal Development Permit (**CDP**) to allow for the construction of a new 9,219 square-foot, one-story, single-family residence, including a 1,000 square-foot subterranean two-car garage, a 1,523 square-foot basement, a 676 square-foot gym, a detached 465 square-foot guest house, swimming pools, a spa, driveways, decks, landscaping, water features, hardscape, grading, retaining walls, and an onsite wastewater treatment system (**OWTS**);

- A Certificate of Compliance (**COC**) to recognize an illegal created lot consisting of two Assessor Parcel Numbers (**APNs**) 4459-013-021 and 4459-014-018;

- A Lot Merger to consolidate two existing parcels into one, located in the Rural Residential, Two-Acre zoning district at 25200 Pacific Coast Highway; and

- A Class 3 categorical exemption from CEQA.

Recognizing the potential for serious public safety and scenic impacts upon local residents of and visitors to Malibu, we write on behalf of the Concerned Citizens of Malibu Road to ask the Planning Commission to deny the CDP, COC, Lot Merger, and Class 3 categorical exemption for the Project as proposed, and to order preparation of an initial environmental study as mandated by CEQA. We have carefully reviewed the staff report and other documents prepared for the consideration of this Project, including the response letter provided by Feffer Geological Consulting on August 20, 2025. In this letter and the attached letter from our geotechnical engineering expert, Pacific Coast Land Consulting, we rebut the conclusions those documents reach and also put forth additional arguments as to why the Commission should deny the Project as currently proposed.

The Planning Commission Should Deny the CDP for the Project as Proposed

The City's Certified Local Coastal Program (**LCP**) requires that four express findings be made and supported by substantial evidence. Two such findings include LCP Section 13.9(A), which mandates that the Project conforms with the entirety of the certified LCP, and Section 13.9(C), which mandates that the Project is the "*least* environmentally damaging alternative." (Italics added.) As we discuss below, the Project, as currently proposed and conditioned, fails to substantiate these findings.

1. Geotechnical Issues and Slope Stability

Section 30253 of the California Coastal Act, as described in Chapter 4(B) of the LCP's Land Use Plan (**LUP**), requires new development to "assure stability and structural integrity," and to neither "create nor contribute significantly to erosion, geologic instability, or destruction of the site or surrounding area." The LCP's Local Implementation Plan (**LIP**) regulations enforce this state mandate by requiring that specific findings be made relating to hazards. This includes that the Project "will neither be subject to nor increase instability of the site or structural integrity" from geologic and other hazards "due to project design, location on the site or other reasons";[1] and that the Project is the least environmentally damaging alternative.[2] These findings must be supported by substantial evidence in the record.[3]

[1] Malibu LIP, § 9.3(A)(1).
[2] *Id.* § 9.3(A)(3).
[3] *Id.* § 9.3(A).

First, proposed new developments subject to geological hazards must substantiate these findings by including a geotechnical report that adheres to the City of Malibu's "Guidelines for the Preparation of Engineering Geology and Geotechnical Engineering Reports" (**Geotechnical Report Guidelines** or **Guidelines**).[4] In doing so, the report must include the statement that the project is "suitable for the proposed development, that the development will be safe from geologic hazard, and that the development will in no way contribute to instability *on or off the subject site*."[5] (Italics added.) Likewise, the Geotechnical Report Guidelines require that slope stability reports in hillside areas "address the potential for surficial instability, debris/mudflow, rockfalls, and soil creep on *all slopes* that may affect the proposed development *or be affected by the proposed development*."[6] (Italics added.) The Guidelines require that applicants both "disclose and address any geologic hazards that are on or adjacent to the site and that affect the site," as well as "discuss and address the effects of the proposed development on adjacent properties" over time.[7]

The Project site, as well as other surrounding properties, are located in an area of great geological concern. The site falls within the City-designated Malibu Road Landslide Assessment District No. 98-3,[8] and within the Malibu Beach Quadrangle Landslide Zone[9] as designated by the state under the California Seismic Hazard Zone Mapping Act of 1990.[10] As described in the response letter from Pacific Coast Land Consulting (attached as Exhibit A), the reports completed by Feffer Geological Consulting fail to adequately reflect actual conditions at the Project site. Feffer's logs contain serious gaps and reduced descriptive detail. Lacking relevant data, they mislead and, as such, fall short of the standard of care for geotechnical engineering. They fail to adequately define the landslide movement affecting the site, as well as the adjoining downslope properties that will disproportionately bear the adverse consequences, like structural damage or loss, of future slope failure. Limited Project analyses have failed to demonstrate off-site stability for surrounding areas affected by the proposed development, yet also suggest the likelihood of off-site slope failures during seismic events. These reports' slope stability analyses have also not yet adequately resolved a variety of concerns described in Exhibit A, showing discussions insufficient to substantiate the key assumptions made for the Project. Geotechnical reports must incorporate "all" geotechnical data previously collected for both the subject site and adjacent sites.[11] It cannot be said that the Project, with its unresolved discrepancies with historic site reports and selective use of instrumentation, has done so in the

[6] Geotechnical Report Guidelines, at p. 35.
[7] *Id.* at p. 27, 30.
[8] Commission Agenda Report, Item 4.A. (August 18, 2025), at p. 4.
[9] *Id.* at p. 23; see also the California Geological Survey's Seismic Hazards Zone Application, where the Project site can be publicly searched. https://maps.conservation.ca.gov/cgs/informationwarehouse/eqzapp/#data_s=id%3AdataSource_4-191d8e56eb9-layer-22%3A7961.
[10] Pub. Resources Code, § 2690 et seq.
[11] Geotechnical Report Guidelines, at p. 8, 19.

manner necessary to establish substantial evidence of stability or of the least environmentally damaging alternative.

Second, the LIP sets out specific development standards for the slope stability analyses provided in geotechnical engineering reports. Under Sections 9.4(D) and 10.4(D)(1), the Project must be located only where a static factor of safety of at least 1.5 and a pseudostatic factor of 1.0 can be ensured. For any new developments demonstrating a lesser factor of safety, the Geotechnical Report Guidelines require either necessary mitigation measures or a project redesign to bring the factor up to the minimum.[12]

Feffer's geotechnical reports (including the report dated November 18, 2021) reveal that the Project site, whose natural slopes only achieved static factors of safety between 1.076 to 1.234, could only achieve the minimum 1.5 standard after the addition of mitigation measures such as soldier piles, freestanding piles, iterative adjustment of pile loads, and a variety of other engineering techniques. These conditions echo those present in the Planning Commission's approval of CDP No. 24-014, heard only a few weeks ago at a public hearing on November 3, 2025, where the Commission determined that a proposed single-family residential development (similarly located on the Pacific Coast Highway only a few miles from the Project) was noncompliant with the Malibu LIP because the required 1.5 factor of safety was not met. Since the project there could only meet the minimum 1.5 static factor of safety after the inclusion of proper mitigation technics and design measures, the Commission required that the project apply for a variance from the applicable LIP.[13] The Commission's approval of that project only with a variance precludes approval of the Project as proposed. If CDP No. 24-014 was noncompliant for failing to achieve the minimum factor of safety absent mitigation measures, then it cannot be said that there exists substantial evidence to support this Project's total compliance with the Malibu LCP.

Third, even if new developments are considered permissible where the minimum factor of safety is provided only following proper engineering and mitigation measures, this stability must be achieved long-term. The Geotechnical Report Guidelines provide that the "minimum *long-term* factor of safety is 1.50 for all new construction of habitable structures," including single-family residences and guest houses.[14] The Malibu LIP adds on to this requirement in Section 10.4(B), by which new development on oceanfront bluffs must be sited outside areas subject to hazards "at any time during the full projected 100 year economic life of the development." This standard necessarily requires that development plans be designed to ensure long-term stability over a projected 100 year economic life of the new development, including by considering hazards that both currently affect the property "as well as hazards that can be anticipated over

[12] *Id.* at p. 37. The Guidelines also state that the site-specific conditions on "most" proposed development sites may necessitate that these minimum standards be exceeded. *Id.* at p. 7.
[13] Commission Agenda Report for CDP No. 24-014, Item 4.C. (November 3, 2025), at p. 10.
[14] Geotechnical Report Guidelines, at p. 37.

the life of the structure."[15] This includes, in some instances, the consideration of slope instability and expected erosion over 100 years.[16] Analyses solely limited to short-term periods or conditions are insufficient for these purposes.

In 2024, the Commission required a variance to approve a project whose design could not achieve a sufficient 100-year economic life elevation required by LIP Section 10.4(A).[17] So too here. The Applicant must demonstrate that its Project complies with the Malibu LIP provision and that the Project will remain the least environmentally damaging alternative considering this time period. It has not done so; its analyses, focused primarily on short-term or static factors of safety, do not address the potential for long-term creep or deformation identified in the site's report history. Consistently unresolved issues relating to Feffer's analyses of landslide geometry and groundwater conditions prevent a finding of long-term stability over the Project's lifetime, accounting for geologic hazards that may arise in that period.[18]

In sum, the Project lacks the substantial evidence necessary to support the Planning Commission's required geological findings under Chapters 9 and 10 of the Malibu LIP, and the CDP must therefore be denied.

2. Impacts on Scenic and Visual Resources

Under Section 30253(5) of the Coastal Act, as incorporated in Malibu LUP Chapter 4(B), new development must protect "special communities and neighborhoods which, because of their unique characteristics, are popular visitor destination points for recreational uses." The LIP implements this policy by requiring the Commission to make findings that, among other things, the proposed project "will have no significant adverse scenic or visual impacts due to project design, location on the site or other reasons"; that the project is "the least environmentally damaging alternative"; and that there are "no feasible alternatives to development that would avoid or substantially lessen any significant adverse impacts on scenic and visual resources."[19] Section 6.4(B) expressly provides that, if necessary to conform to development standards, the proposed development "shall be modified, by special condition, relative to height, size, design, or location on the site" to avoid or minimize the project's adverse scenic impacts.

Pacific Coast Highway, along which 1,692 linear feet of the Project fronts,[20] is designated as a Scenic Road under LUP Policy 6.3(a). The scenic views from PCH are accordingly protected under LIP Sections 6.5(E)

---

[15] Malibu LUP, Policy 4.23.
[16] Malibu LIP § 10.4(D)(2).
[17] Commission Agenda Report for CDP No. 22-031, Item 5.C. (October 21, 2024), at p. 2.
[18] See, e.g., *Lindstrom v. California Coastal Com.* (2019) 40 Cal.App.5th 73, 97 [overturning a CDP approval where the project applicant could not demonstrate site safety under a similarly applicable 75-year lifetime requirement].
[19] Malibu LIP § 6.4(A)(1), (3), (4).
[20] Commission Agenda Report, Item 5.A. (July 21, 2025), at p. 19.

and 6.5(H). As a result, new development must be sited and designed to *minimize* adverse impacts on Scenic Areas visible from Scenic Roads "to the *maximum* feasible extent."[21] As stated in the LIP, this may be accomplished by methods like restricting the building maximum size or by reducing maximum height standards.[22]

The Project, as proposed and conditioned, will be visible from the Pacific Coast Highway at a height that partially obstructs bluewater views over the development.[23] Without evidence, the July 2025 staff report claims that this is nevertheless the least environmentally damaging alternative, and that reducing the Project's total development square-footage would not necessarily result in less view impacts because building heights could continue to be 18 feet; and that other project design alternatives would require substantially more retaining walls and grading in excess of LIP limits.[24]

These statements fail to consider the City's authority, under the above-referenced sections of the LIP, to reduce volumetric mass or maximum allowable height. Such mitigation would avoid any need for substantially more retaining walls and grading, further encroachment into slope stability, or relocation of the structures elsewhere on the parcels. The Planning Commission and City staff may not, by law, defer to an applicant's preferred project size and design, given that a CPD applicant is "not entitled to whatever project it desires." (*Charles A. Pratt Construction Co., Inc., v. California Coastal Com.* (2008) 162 Cal.App.4th 1068, 1082; see *Mein v. San Francisco Bay Conservation etc. Com.* (1990) 218 Cal.App.3d 727, 735 [statutory requirement that fill area be the "minimum necessary" to achieve the purpose of the fill cannot be evaded because a smaller house would not have accommodated the project's proposed design; " 'minimum necessary' does not mean the minimum necessary for the particular size or style desired by the applicant."].) No applicant has "a vested right to develop his property in a particular fashion."[25] To find otherwise would be a prejudicial abuse of discretion, and in this case, worse: potential damages liability for the City upon future slope failure. Ultimately, the Applicant has not demonstrated substantial evidence to support the findings required by Chapter 6 of the Malibu LIP. For that additional reason, the Project, as designed, cannot be approved.

<u>The Planning Commission Should Reject the Class 3 CEQA Exemption</u>

The California Legislature enacted CEQA to "protect, rehabilitate and enhance the environmental quality of the state."[26] This fundamental state policy demands that permitting agencies at the state and local levels enhance environmental quality, including by preserving enjoyment of aesthetic, natural, and scenic

[21] Malibu LUP Policy 6.5; Malibu LIP § 6.5(A)(1).
[22] Malibu LUP Policy 6.5; Malibu LIP § 6.5(A)(1).
[23] Commission Agenda Report, Item 5.A. (July 21, 2025), at p. 16.
[24] *Id.* at p. 18.
[25] *Paoli v. California Coastal Com.* (1986) 178 Cal.App.3d 544, 550-551.
[26] Public Resources Code § 21001, subd. (a).

environmental qualities.[27] To these ends, CEQA exemptions must be construed narrowly to afford the fullest possible environmental protection.[28] These exemptions are therefore reserved for projects which have been determined not to carry significant environmental effects.[29] In evaluating claims arising under CEQA, courts determine the existence of substantial evidence in the record as a matter of law.[30]

The Class 3 categorical exemption, relied upon here by the Applicant and City staff, is exempts the "New Construction or Conversion of *Small* Structures." (Italics added.)[31] Class 3 "consists of construction and location of limited numbers of new, small facilities or structures; installation of small new equipment and facilities in small structures; and the conversion of existing small structures from one use to another where only minor modifications are made in the exterior of the structure." The section then provides examples of this exemption. This Project specifically relies on the examples listed in subdivisions (a) and (e), which include:

(a) One single-family residence, or a second dwelling unit in a residential zone.[32]
(e) Accessory (appurtenant) structures including garages, carports, patios, swimming pools, and fences.[33]

As we show below, the Class 3 categorical exemption is inapplicable here, and even if this wasn't so, exceptions require that the Project undergo environmental review under CEQA.

1. The Proposed Project is Outside the Scope of the Exemption

The Project weighs far beyond the scope of the Class 3 categorical exemption. In 1991, the Court of Appeal determined that the "Secretary of Resources made the ultimate finding in determining that single-family residences *of the type there sought to be built* were categorically exempt from CEQA under the Class 3 exemption.[34] There, the proposed residence was a small structure: 2,700 square-feet.[35] In fact, of all 22 published court opinions involving a project that relied on the Class 3 exemption, every proposed single-family home measured less than 6,500 square-feet.[36] Here, however, the Project attempts to brute

force a 9,218 square-foot "single-family" mansion through an exemption specifically designed for "small" new structures.[37] The Project in its entirety, with a total development square-footage (**TDSF**) of 11,121 square-feet, is large enough to take up *99.5 percent* of the City's maximum allowable TDSF for a given parcel.[38] Allowing a project so close to maximum allowable to be exempted from CEQA perverts the Class 3 categorical exemption, the required narrow interpretation of which should not allow this massive development to characterize itself as "small" in any sense -- especially in the site's nonurban setting. This is a project that must undergo CEQA review, at the minimum through the City's preparation of an initial study to determine whether a Negative Declaration or an Environmental Impact Report should be prepared. An initial study would facilitate public circulation of the Project to responsible and trustee agencies, as well as the public. That's called public accountability. The Commission lacks substantial evidence to approve the Class 3 categorical exemption for this Project and must instead mandate CEQA review.

2. Exceptions to the Exemption Justify Environmental Review

Even regardless of whether the Project is a "small" structure (and it is not), exceptions under Section 15300.2 of the CEQA Guidelines preclude use of the exemption recommended by staff. As detailed below, the unusual circumstances exception, the location exception, and the scenic highways exception each take the Project outside of the Class 3 exemption.

a. Unusual Circumstances Exception

The unusual circumstances exception precludes the use of a categorical exemption "for an activity where there is a reasonable possibility that the activity will have a significant effect on the environment due to unusual circumstances."[39] The California Supreme Court established the standards for this exception in *Berkeley Hillside Preservation v. City of Berkeley* (2015) 60 Cal.4th 1086, where it provided two alternative analyses in assessing whether the exception applies. We discuss each alternative in turn below.

i. First Alternative

Under the first alternative, a challenger must demonstrate that (1) no substantial evidence supports the conclusion that the project has some feature that distinguishes it from others in the exempt class, such as its size or location; and (2) there is a reasonable possibility of a significant effect on the environment due to that unusual circumstance.[40]

---

830 [1,208 square-feet]; *Salmon Protection & Watershed Network v. County of Marin* (2004) 125 Cal.App.4th 1098 [3,649 square-feet]; *Association for Protection etc. Values*, *supra*, 2.Cal.App.4th 720 [2,700 square-feet].

[37] Commission Agenda Report, Item 5.A. (July 21, 2025), at p. 9.

[38] *Ibid.*

[39] CEQA Guidelines § 15300.2, subd. (c).

[40] *Bottini*, *supra*, 27 Cal.App.5th at p. 305.

First, the Project's size clearly distinguishes it from other projects that have relied upon the Class 3 categorical exemption. As mentioned above, in none of the 22 published court opinions has a Class 3 exemption ever been used to exempt a single-family home larger than 6,500 square-feet. The Project's unusual size, however, is not limited by comparisons to case law; it is also highly unusual when compared to single-family projects in the nearby vicinity. Out of all 272 publicly available Notices of Exemption (**NOEs**) filed by the City on California's CEQAnet Web Portal,[41] 176 projects have utilized the Class 3 categorical exemption. Of these 176 projects, 39 have specifically relied on Class 3, subdivision (a) to exempt the development of a single-family home, a second dwelling unit, or a home and its accessory structures. **Not even one** of these 39 projects has a TDSF as gigantic as the 11,121 square-feet proposed here. Indeed, as many as 90% of these projects proposed a TDSF lower than 7,500 square-feet (including 33% of projects with a TDSF less than 5,000 square-feet). Seven percent of these projects proposed a TDSF between 7,500 and 8,555 square-feet, and only one project proposed a TDSF greater than 8,555 square-feet. Square-footage for the vast majority of these projects range even smaller in size when looking at the single-family house alone. Accordingly, this Project's extremely large TDSF constitutes an unusual circumstance that sets it apart from other developments that have relied on the Class 3 categorical exemption not only under case law, but also relative to all other Class 3 projects listed in the City's publicly available NOEs.

The Project's location similarly constitutes an unusual circumstance compared to other Class 3 projects. As discussed above in our analysis of the Project's inconsistency with the Malibu LCP, the Project site is located within the city's Malibu Road Landslide Assessment Area 98-3, and within the state's Malibu Beach Quadrangle Landslide Hazard Zone. The Project's previously mentioned failures to establish a minimum static factor of safety of 1.5, and to demonstrate site stability and safety from hazards over its 100-year economic life, echo the Planning Commission's findings of LCP noncompliance in CDP Nos. 24-014 and 22-031: the only two projects—out of all 39 publicly available City NOEs—whose site conditions were so unstable as to require a variance to the factor of safety. The City, in recognition of these unusual conditions for developments proposing single-family residences, has highlighted in its own public handout that "*typical* residential projects which are *not categorically exempt* and require further environmental study" expressly includes projects "which contain severe geological hazards."[42] Accordingly, both the Project's size and its location are unusual features that distinguish it from other projects exempted under Class 3.

Second, these unusual circumstances create a reasonable possibility of significant effect on the environment. Please refer to our LCP discussion above regarding the significant impacts related to geotechnical hazards and scenic views that this Project, as proposed and conditioned, will produce as a

[41] California Governor's Office of Land Use & Climate Innovation, CEQAnet Web Portal, https://ceqanet.lci.ca.gov/.
[42] City of Malibu, Residential Development — Environmental Review Public Handout, https://www.malibucity.org/DocumentCenter/View/4617/PLN-Residential-CEQA-Exemptions_Public-Handout- (emphasis added).

result of its extremely large size and particular location. Accordingly, the unusual circumstances exception applies and the Project should not receive a Class 3 categorical exemption from CEQA.

ii. Second Alternative

Under the second alternative, a challenger may establish an unusual circumstance "with evidence that the project will have a significant environmental effect."[43] The Project here will have a significant environmental effect, given that Feffer Geological Consulting's reports, including its 2021 report mentioned above, admit the Project's inability to achieve the minimum factors of safety without subsequent engineering and other mitigation measures. These mitigation measures, while perhaps necessary to comply with the City's Geotechnical Report Guidelines and LUP Policy 4.5, constitute conditions of approval that are imposed to mitigate significant effects and make the Project qualify for an exemption in the first place. This is contrary to the Secretary of Resource's determination that projects receiving a categorical exemption are those "determined not to have a significant effect on the environment."[44] Conditions of approval, such as the Project's mitigation measures to achieve the minimum factor of safety, cannot be the basis for a categorical exemption; mitigation measures must instead be evaluated through proper environmental review. (*Salmon Protection & Watershed Network*, *supra*, 125 Cal.App.4th at 1106 ["an agency should decide whether a project is eligible for a categorical exemption as part of its preliminary review of the project without reference to or reliance upon any proposed mitigation measures." (internal citations omitted)].)

The Project will produce significant environmental effects due to its failure to achieve the factor of safety required by the City's Geotechnical Report Guidelines and the Malibu LCP. By requiring engineering techniques in the conditions of approval that subsequently allow the Project to achieve this standard, the Project explicitly relies on mitigation measures to achieve "no significant effect on the environment." These mitigation measures constitute an unusual circumstance that necessitates not a categorical exemption, but rather proper environmental evaluation under CEQA.

b. Location Exception

`The Class 3 exemption may not be used where a project "may impact on an environmental resource of hazardous or critical concern where designated, precisely mapped, and officially adopted pursuant to law by federal, state, or local agencies."[45] *Berkeley Hills Watershed Coalition* established two prongs of inquiry for this exception: (1) whether the project is located within an environmentally sensitive area, and (2)

[43] *Berkeley Hillside Preservation*, *supra*, 60 Cal.4th at p. 1105 (emphasis added).
[44] CEQA Guidelines § 15300.
[45] CEQA Guidelines § 15300.2, subd. (a).

whether substantial evidence supports a "fair argument" that the project "may impact" the mapped resource.[46]

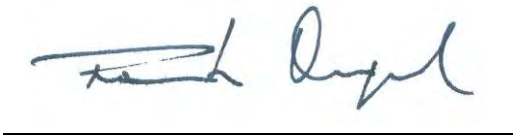
Public views constitute an environmental resource. (See Public Resources Code Section 21060.5 [defining "environment" as including those physical conditions which will be affected by a proposed project, including land, air, water, and objects of aesthetic significance]; see also Malibu LUP Chapter 6(B), Coastal Act Section 30251 ["Scenic and visual qualities of coastal areas shall be considered and protected as a resource of public importance"].) As a result of this designation, Chapter 6 of the Malibu LUP and the sections of the Malibu LIP implementing Section 30251 require new developments to mitigate a project's adverse impacts on ocean views, "whether significant or not."

A substantial portion of the site fronts the Pacific Coast Highway, which has been designated as a protected Scenic Road pursuant to the Malibu LCP.[47] As described above in our analysis of the Project's consistency with Chapter 6 of the Malibu LIP, the project as proposed will adversely affect views of the Scenic Area ordinarily visible from the Pacific Coast Highway by residents and visitors. This stands contrary to the Court of Appeal's determination that a project in the coastal zone "must be developed in such fashion that the adverse impacts, *whether significant or not*, be sufficiently mitigated." (*Paoli v. California Coastal Com.* (1986) 178 Cal.App.3d 544, 551, italics added [construing Coastal Act Section 30251; rejecting a permittee's challenge to a Commission decision requiring an open-space easement condition to mitigate public view impacts].) *Paoli* makes clear that, under the Coastal Act, even a partially (not fully) impacted public view qualifies for permanent protection ("as a resource of public importance"), if not for restoration or enhancement. (*Id.*; see § 30001, subd. (b); Malibu LUP, Policy 6.1; Malibu LIP, Section 6.1.) Accordingly, the Project qualifies for the location exception to a categorical exemption because it is located along the Pacific Coast Highway, which has been mapped as a Scenic Road; and substantial evidence supports a fair argument that the Project will at least partially obscure public views as an environmental resource of public importance.

c. Scenic Highways Exception

The scenic highways exception applies to projects "which may result in damage to scenic resources, including but not limited to, trees, historic buildings, rock outcroppings, or similar resources, within a highway officially designated as a state scenic highway."[48] As mentioned in our discussion of Chapter 6 of the Malibu LCP and our discussion of the location exception, public ocean views -- by definition -- are scenic resources under CEQA and the Malibu LCP. The designation of the Pacific Coast Highway as a Scenic Road, and the Project's adverse effects on residents' and visitors' public views of Scenic Areas

[46] *Berkeley Hills Watershed Coalition*, *supra*, 31 Cal.App.5th at p. 894.
[47] Malibu LUP, Policy 6.3(a).
[48] CEQA Guidelines § 15300.2, subd. (d).



along the heavily traveled Pacific Coast Highway, renders this exception applicable. Thus, the Project may not be approved without proper environmental review under CEQA; the Planning Commission must deny the Project a Class 3 categorical exemption.

Conclusion

In sum, we respectfully submit that for the Planning Commission to approve a CDP and CEQA exemption for a project design so badly flouting the Malibu Local Coastal Program and circumventing CEQA review as this Project in this location will be a prejudicial abuse of discretion. The CDP and CEQA exemption must be denied. This will be without prejudice to the Applicant's ability to return with an LCP-compliant application.

Sincerely,

ANGEL LAW

Subject: RE: REMAINING UNADDRESSED ITEMS – REVIEW OF FEFFER GEOTECHNICAL REPORT
Project: 25200 Pacific Coast Highway, Malibu, California

1.0 INTRODUCTION

We have reviewed Feffer Geological Consulting's response titled "RESPONSE TO CITY OF MALIBU GEOTECHNICAL REVIEW COMMENTS," dated August 20, 2025, which was prepared in reply to concerns raised in Pacific Coast Land Consulting's original technical letter (Pacific Coast Land Consulting, PRELIMIARY REVIEW OF FEFFER REPORT AUGUST 15, 2025) authored previously. While the August 20, 2025 response summarizes selected data and provides additional narrative discussion, it does not address all of the technical concerns identified in the original PCLC letter, and several critical issues remain unresolved or only partially addressed.

These unresolved issues are fundamental to accurately characterizing site conditions, evaluating landslide hazards, and designing a stabilization system. Because the proposed development is located upslope of existing residences along Malibu Road, any remaining uncertainty regarding slope stability or groundwater conditions has the potential to adversely affect off-site properties. Accordingly, this letter provides clarification of the outstanding concerns that were not fully addressed in Feffer's August 20, 2025 response and explains why additional evaluation is warranted.

Geologic investigations are often challenging, it is rare situation where a site exists with so much data to evaluate and use as part of the investigation. As Mr. Feffer knows investigation on this

site go back into the 1960s, There have been numerous landslide events in this area. Enough so that lead to the establishment of the Malibu landslide Assessment District.

Malibu has an inordinate number of landslides, all of which are quite complex due the geologic conditions. These include Big Rock Mesa, Eagle Pass-Las Flores, Latigo Bay Villas and numerous others. All of these slides have at least one thing in common and that is the failure to build a correct and accurate geologic model for analysis. The issue here is not that this development should be built but that it needs to be built using the correct model. The residents below this proposed development are very concerned that the proposed work will have a negative impact on their homes. Their concerns are valid, for the reasons previously presented. Mr. Feffer's response only adds additional concern to the residents by not considering the geological questions previously presented.

2.0 REGULATORY AND PROFESSIONAL OBLIGATIONS

Further, the introduction of deep stabilization elements such as piles or caissons on the upper parcel may increase risk to downslope properties if slide geometry, depth, or continuity are not correctly defined. Partial stabilization of an upper portion of a landslide mass can create a false sense of stability, while transferring stresses to deeper or downslope portions of the slide mass that have not been analyzed. If deeper or secondary slide surfaces exist below the embedment depth of the piles, the added rigidity and disturbance associated with pile installation may redirect or concentrate movement downslope rather than arrest it.

Temporary construction effects also warrant consideration. Drilling disturbance, spoils handling, vibration, and short-term groundwater changes associated with pile installation were not evaluated, yet may be critical in an area with a history of slow landslide movement.

Analyses focused primarily on short-term or static factors of safety do not address the potential for long-term creep or progressive deformation, which is consistent with the documented inclinometer history at this site and must be evaluated over the projected economic life of development.

Additionally, any adverse consequence of a mischaracterized geologic or stability model would be asymmetrically borne by downslope properties, where even small increases in movement or groundwater pressure could result in structural damage or loss, as demonstrated by historic

landslide failures in this area. These considerations further underscore the necessity of fully evaluating off-site conditions before the required stability findings can be made.

3.0 STANDARD OF CARE FOR LANDSLIDE INVESTIGATION

The proper procedure for investigating any site is to gather all data and utilize it in a comprehensive analysis. This means paying attention to all data and not picking and choosing favorable data points while ignoring less favorable data. Neither I nor Mr. Feffer were present for any of the earlier work. We have to accept the observations and geologic data as they are presented in the logs. This means relying on observations locations depths orientations and descriptions.

Typically, it takes 3 things to confirm the presence of sliding ancient or active (with instrumentation).

1) Geomorphic evidence – the shape of landform, offset in stream beds, hummocky terrain etc. Landforms are often altered with time, as erosion occurs and man modifies the terrain, The result of this is obscure some features such as boundaries, stream beds and alignments.
2) Subsurface investigation- Borings are drilled and geologists go down into the borings and record their observations and collect data such as geologic attitudes on bedding, fractures clay seams and slide planes.

   Protocol for logging is to identify every single vertical inch of the column of rock exposed in the boring. Thus, logs are created with lines drawn to show where one lithology with a particular characteristic end and another begins. Stone logs from 1962 did this and Feffer's logs did not, neither did Cy logs.

   This data is then prepared in log format for others to review and analyze. One of the important observation a geologist makes while down hole is to note the character of the earth material. Words like smashed up, (a colloquial term) fractured pulverized re-worked

etc. are used to denote bedrock materials that have been disturbed by movement, usually landslide activation.

Often a geologist will identify a slide plane. These features can be very thin. 1/16" or less to several inches in thickness. Term like polished surfaces with striation surface, basal surface, slide or glide plane (glide is colloquial and not used much anymore but the descriptive nature of the word and meaning is clear: **movement along a discrete plane** .

Other terms in observations made by a. geologist when down hole include. Striations and slicks. These are synonyms, Striation or slicks (short for slickensides are. fine scratches or grooves cut into rock opposing rock faces as one block moves past another. This can be caused by faulting internal shifting of major blocks. But is most often associated with landslide movement and is often the signature of a landslide.

3) Instrumentation- The main instrument in analyzing a landslide are inclinometers. These are indexed pipes put into suspected active landslide and then monitored by comparing an initial or base reading to subsequent readings. The accuracy of this system is typically .1" over a length of 100'. Thus, repeatable movements however small mean that this is an active slide. Instrumentation is typically what you see is what is there type of data point. The only exception to this is by changing the initial reading. This resets the vertical baseline reading back to a straight line and eliminates evidence of previous movement.

4) Once the data is collected and assembled on map the next step is develop a structure contour map of a surface defined by an accumulation of all the datapoints, logs and instrumentation. This is done by plotting the elevation of the surface of interest at a particular location boring or inclinometer. It is done for all the borings and inclinometers. If this results in a chaotic mess where elevations **don't** project from one boring to another or a point on an inclinometer then it is likely that the feature investigated is not a slide, has other origins. Contrarily, if the data points do line up on an evaluation basis and spatial basis a map of slide plane has been created that relies on all data. This is called a

structure contour map. It is the standard of care in developing a model to be analyzed with slope stability programs. The detail and continual logging notes for the boring must be complete and detailed enough to complete this critical. Task. Feffer's work did not accomplish this.

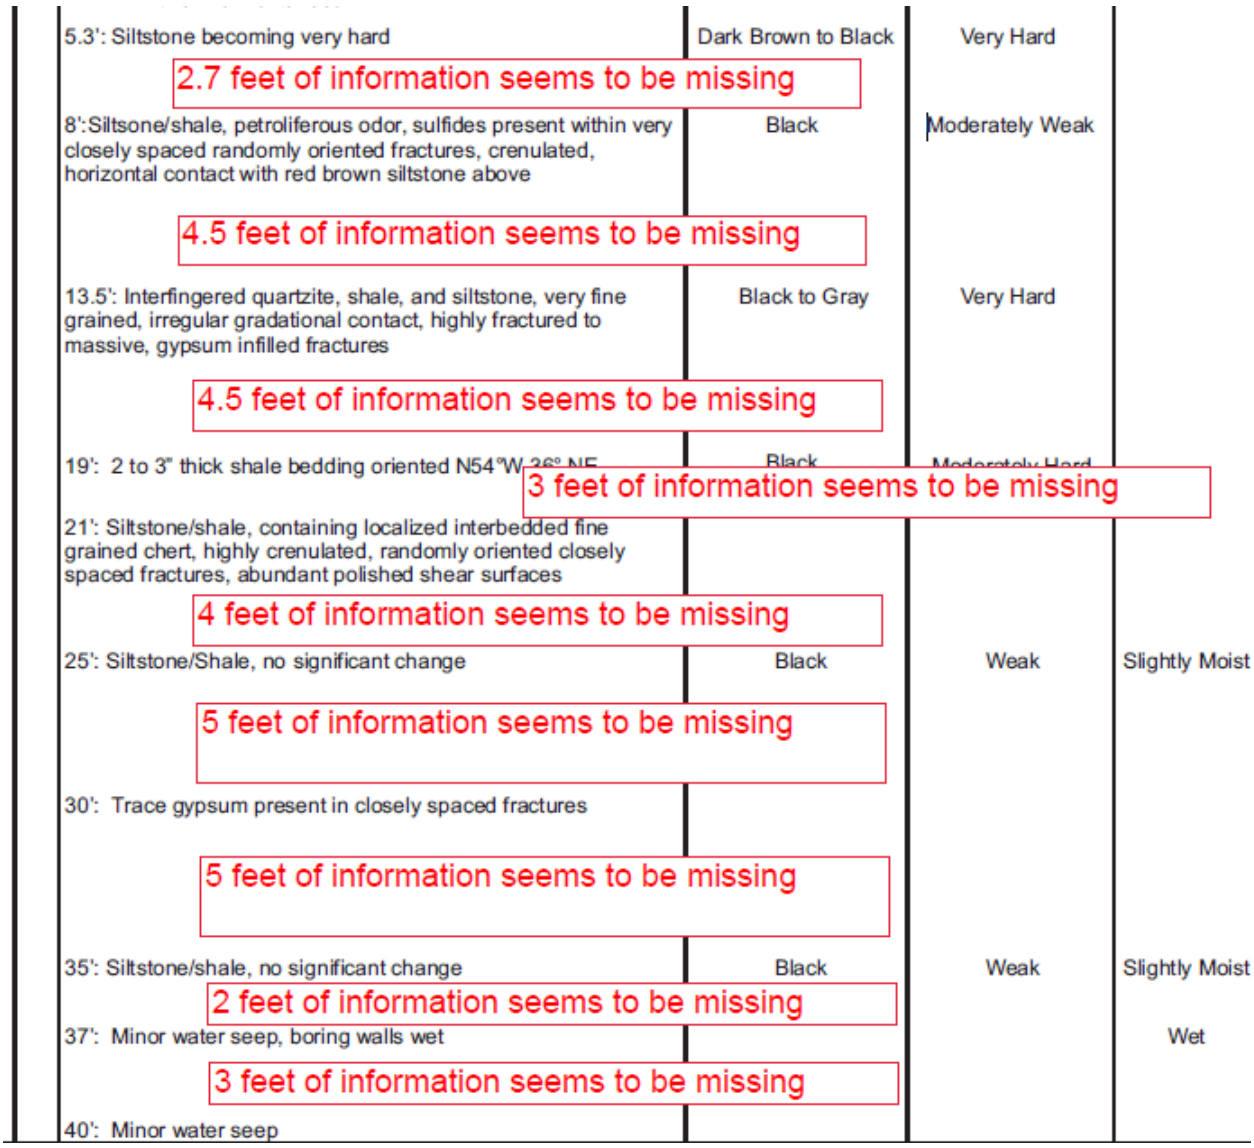
5) Groundwater Modeling. The ground water table needs to be established with potential high levels to be used in the slope stability analysis.

3.1 GEOMORPHIC EVIDENCE

Surface features such as hummocky terrain, disrupted drainage, and slope breaks often indicate past or ongoing landslide activity. Although erosion and grading can obscure these features over time, their partial removal does not negate their original significance.

3.2 SUBSURFACE INVESTIGATION

The concerns regarding the characterization of subsurface materials in Feffer's borings remain unaddressed. Specifically:



- Older consultants' reports documented crushed, disturbed, or sheared materials consistent with landslide deposits, while Feffer logs classify similar intervals as "bedrock" without explanation.
- Gaps in log descriptions at depth and a lack of detailed material characterization were not addressed and did not meet the industry standard of care.
- No explanation was provided for discrepancies between historic logs and Feffer's own interpretation.

As stated in the prior technical letter, continuous subsurface investigation is critical to defining landslide geometry and failure mechanisms. Continuous boring logs are essential. Industry standards require logging every vertical inch of the borehole and documenting lithology changes, shear zones, bedding attitudes, fractures, clay seams, and disturbed materials. Terms such as *smashed*, *jumbled*, *pulverized*, *reworked*, *slickensides*, and *polished shear surfaces* are commonly used to describe materials disturbed by landslide movement.

Historic logs prepared by STONE SUBSURFACE EXPLORATION LOGS, MALIBU ROAD AREA, MALIBU, CALIFORNIA. 1962. meet this standard. By contrast, Feffer's logs—and earlier CY logs—contain gaps and reduced descriptive detail, limiting their usefulness in defining slide geometry and does not meet the standard of care for geotechnical engineering. Feffer log **B-3** was only intermittently logged with notations every 5' that only denoted fracturing and gypsum in filled cracking (evidence of dilation - movement) A zone of interest, that would correlate with SG 6 and 7 would be from 25'-45' but there were not continuous observations

Feffer log **B-5** reads like landslide however the category description has been described as bedrock. The bedding orientations are southwards towards the beach. However, there are multiple gaps in the logs and the log appears biased towards a non-slide condition despite containing observations of shearing and clays tilted towards the south. The boring is well into the pad area and was previously identified as a slide.

3.3 INSTRUMENTATION AND SYSTEM RESET

The analysis of any slide is only as good as the model developed. And this. means that all data must be considered, for what it is and not subject to interpretation. Feffer's statement that both SI-5 and SI 6 conclude that no "significant movement" is wrong. If Feffer had taken a careful look at all the data in these 2 inclinometers he would have discovered that the appearance of no movement results from a change in the date of the base line readings. Inclinometers operate on a comparison basis. Subsequent readings are then recorded to that initial base line, and the resultant plot shows the depth and magnitude of the offset.

In this situation for SI-5 the initial reading was taken on 8-17-2004. This is the base line reading to which all future readings are to be compared. However, this was not used until the report of 2018-2019 by Fugro in the plots and it is at that time the offsets in SI-5 are clearly visible.

The rest of the readings arbitrarily use a later base line reading in this case the other "initial reading" were on May of 2005. This has the effect of straightening out the plots by eliminating readings between 2004 and 2005.
For SI-6 the earliest identifiable movement occurs at a depth of 38 feet in the 2008-09 report from Fugro.
Incremental displacements are continuously recorded in almost all Fugro report despite initial reading date being changed during plotting. Cumulative displacements plot as much as .2 inches as recently as June 2020.

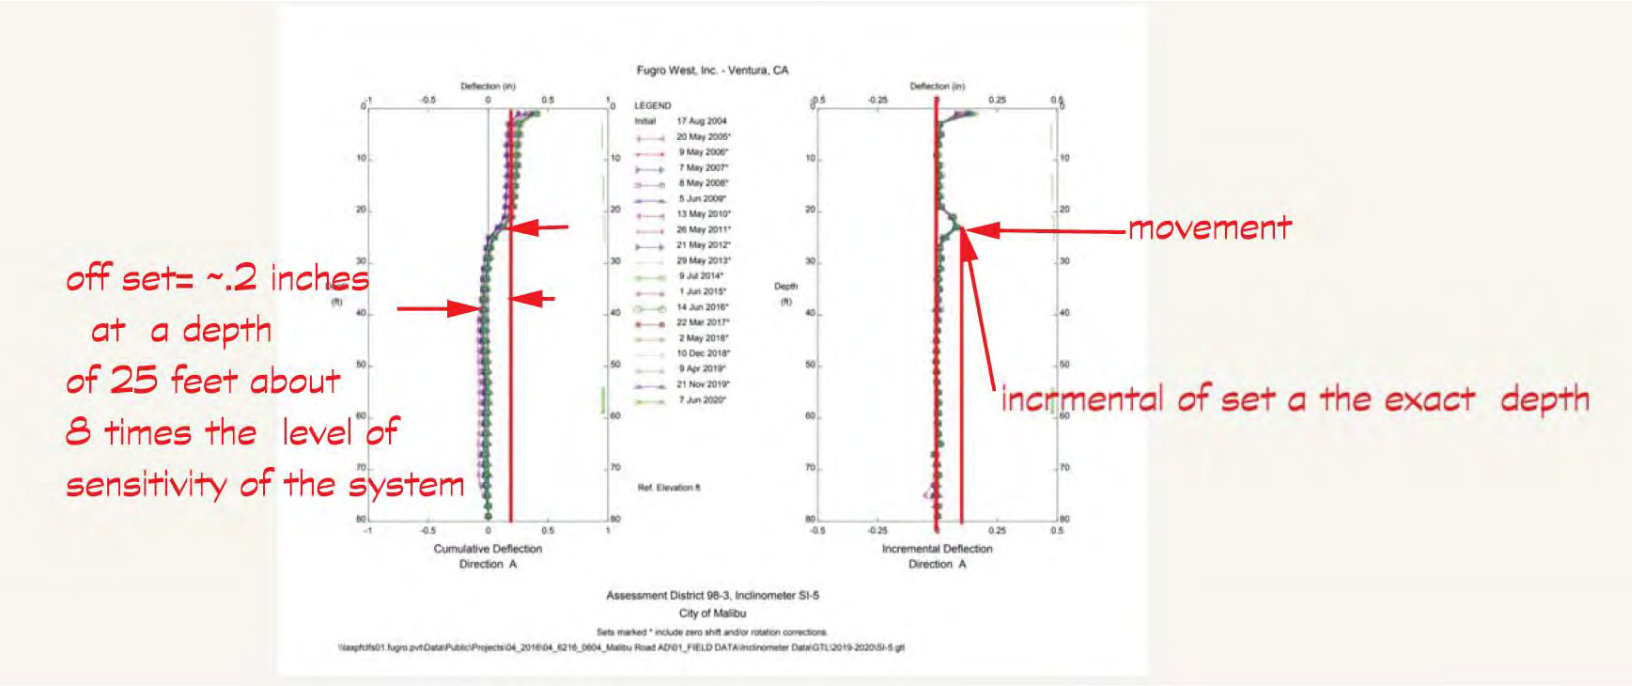
What is meant by significant movement? How much movement is insignificant? The answer lies in the plots of the inclinometers. If it was, just one inclinometer that had some reading would be suspicious but to have 2 inclinometers show similar results over years of monitoring indicates that slow slide movement is continuing.
Therefore, this data. must be accounted for in the landslide and slope stability model. It wasn't even considered in more than a cursory brush over.

It has now been established that there exist in the body of data significant and numerous points representing the slide plane. The next step is to develop the structure contour and this is as simple as connecting the data points on the slide. If this can be done and it has then the slide is much larger than Feffer's analysis.

It is not the standard of care to just simply connect the dots. This approach leads to an inaccurate and incomplete analysis of the geometry of the slide. If the geometry of the slide is not accurate then subsequent engineering and slope stability, is based upon an inaccurate model and also incorrect.

These issues affect the reliability of the geologic model and the validity of later engineering analyses.

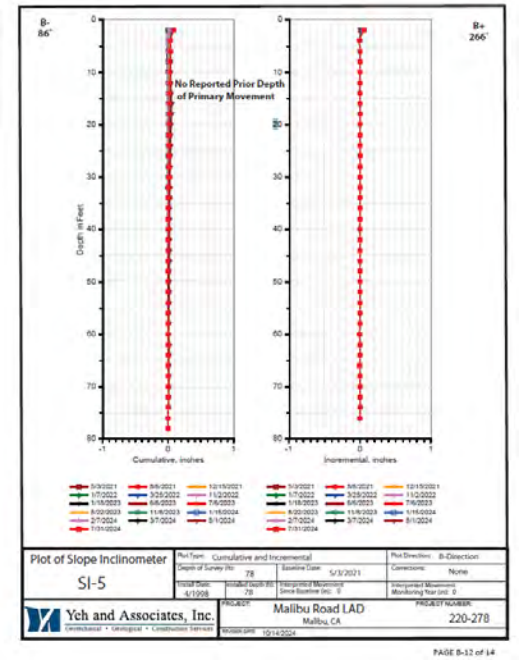
Feffer should address:



- Why are Feffer's own logs significantly less detailed than prior logs
- Feffer's logs contain "gaps in the observations"
- Feffer may have misclassified smashed, jumbled, crushed/chaotic materials as "bedrock"
- Feffer ignores identifications of slide surfaces
- Feffer's inclinometer analysis seems to have only consisted of reading the annual report and parroting that language
- In the section reviewed some groundwater profile have a vertical drop. There does not seem to be clear explanation of this phenomenon or what data was used to develop the profile.in one section it appears based on faulting but in other sections the water appears continuous. The review of the logs by CY (boring 2) does not show a fault, and it is shown on the section. It is unclear how this interpretation was achieved. Nor does it demonstrate a significant enough gouge zone to act as ground water barrier. The notation of a healed fault plane. @ 10' in Feffers boring B-2 has only a 31degree easterly dip with a north south strike (parallel to the section) which is at 90 degrees to the fault shown in section 2. No other faulting is found in the logs and it is not placed on the geologic map. The evidence for this. feature is questionable and needs additional supporting data.
- Without this data then the ground water table needs to be a continuous profile from the upper pad to the lower portions of the area. The ground water surface should be

1525 Pepper Tree Place, Fallbrook, CA 92028
TEL (760) 473-4117 Email Rnkjeffery@SBCGlobal.net

subparallel to the slope of the land consequently is substantially higher, than that which was analyzed.



Inclinometers provide direct evidence of subsurface deformation. Movements as small as 0.1 inch over 100 feet are meaningful. Resetting baseline readings eliminates evidence of prior displacement and must be explicitly accounted for when interpreting results. The City should have Ye and Associates update the data to show cumulative data from the Fugro reports as this creates misleading design data by wiping out past data with a system reset and defeats the purpose of tracking this data.

Fugro 2019-202 dated August 2020 report (Fugro Consultants, Inc. ANNUAL REPORT JULY 2019 THROUGH 2020 MALIBU ROAD LANDSLIDE ASSESSMENT DISTRICT, MALIBU CA. August 2020, pg 48 of pdf) shows cumulative movement:

System reset wipes out previous data:

Yeh & Associates, Inc 2023-2024 Report dated March 20, 2025 (Ye & Associates Inc**.** FY23/24 MAINTENANCE AND MONITORING AD98-3, MALIBU ROAD CITY OF MALIBU, CALIFORNIA. March 20, 2025, Page B-11 of 14, Page 39 of pdf)

3.4 DEVELOPMENT OF A STRUCTURE CONTOUR MAP AND CITY OF MALIBU ASSESSMENT DISTRICT NO.98-3 MALIBU ROAD AND ASSESSMENT FEES

Once subsurface data are compiled, elevations of suspected slide planes must be plotted and evaluated spatially to determine whether a coherent failure surface exists. If data points correlate spatially and geometrically, a landslide surface has been defined. This step is fundamental and cannot be bypassed. Once this structure map is recalculated with all available data and additional data as recommended, 25200 PCH would likely be in the City of Malibu Assessment District No.98-3 Malibu Road and would be pay fees associated with being in the City of Malibu Assessment District No.98-3 Malibu Road.

3.5 GROUNDWATER MODELING

Slope stability analyses must incorporate realistic high-groundwater conditions, particularly where onsite wastewater disposal is proposed. Groundwater surfaces should generally be subparallel to topography unless well-supported geologic barriers are demonstrated.

4.0 INCOMPLETE OR NON-SPECIFIC LOGGING IN FEFFER BORINGS

Concerns regarding Feffer's subsurface characterization remain unresolved:

- Materials described by earlier consultants as crushed, sheared, or landslide debris are frequently classified by Feffer as "bedrock" without explanation.
- Numerous gaps in logging occur at critical depths.
- Discrepancies between historic logs and Feffer's interpretations are not reconciled.

Stone's SG-6 and SG-7 (STONE SUBSURFACE EXPLORATION LOGS, MALIBU ROAD AREA, MALIBU, CALIFORNIA. 1962), located within feet of Feffer borings, describe smashed, jumbled materials with slickensides between approximately 5 and 42 feet, indicative of landsliding beneath the central building pad. Feffer's nearby borings do not reflect these conditions, despite spatial proximity.

5.0 INCLINOMETER DATA INTERPRETATION

Feffer's response relies on the statement that the inclinometer reports indicate "no significant movement." This phrasing requires clarification in the context of the full inclinometer record. While Feffer cites the City's 2025 Assessment District Report. He merely restates the conclusion without doing any analysis. Feffer's response does not address:

- Why earlier inclinometer interpretations identified movement at 32–39 feet
- Records of data. recording goes back as far as 1989, yet no plots of this data was available or apparently reviewed
- Whether instrument noise, calibration, or reading intervals were evaluated
- Whether incremental and cumulative plots were reviewed in any detail
- Was any effort made to obtain the original data and plot the results independently standardizing the use of the initial readings to the earliest available data.
- There appears that pre 2004 inclinometer readings were taken, however no effort to obtain and review this data was made
- Whether deeper movement potential should be reexamined given historic slide mapping

These discrepancies should be resolved through direct comparison of data sets.

a. Later Assessment District reports (roughly mid-2010s onward)

These reports — especially those Feffer references — commonly state variations of:

- "No significant movement"

- "No shear-type movement"
- "Movement within instrument accuracy"

Important nuance:

- These statements are made after baseline resets, which is significant because a system-wide reset effectively re-zeroed the inclinometer profiles; the fact that all inclinometers were set to zero must be considered when interpreting subsequent plots
- They are typically referring to shear-type movement across a single, discrete plane
- They often do not deny incremental or cumulative displacement

Accordingly, when Feffer states that "the inclinometer reports say there is no significant movement," he is accurately quoting some report conclusions, but only in a narrow, technical sense.

b. Earlier reports (and raw plots within later reports)

Earlier Fugro reports — and the plots themselves even in later reports — show:

- Documented incremental displacement
- Cumulative movement on the order of approximately 0.1 to 0.2 inches
- Recurrent displacement at similar depths in:
    - SI-5
    - SI-6

In several reports (including Fugro's INCLINOMETER MONITORING REPORTS, CITY OF MALIBU ASSESSMENT DISTRICT NO. 98-3, MALIBU ROAD, MALIBU, CALIFORNIA. 2008–2009 and subsequent years):

- Movement is explicitly plotted
- The issue is how it is characterized, not whether it exists

These reports do not state that there is "no movement." Rather, they describe movement as:

- slow,
- incremental, or
- below a threshold the consultant defines as "significant."

c. What "no significant movement" actually means (technically)

In inclinometer practice:

- "Significant" is not a regulated term
- It is consultant-defined

It usually means:

- no abrupt shear plane,
- no accelerating displacement, or
- no emergency condition

It does not mean:

- no deformation,
- no landslide-related movement, or
- no relevance to long-term stability

Accordingly, Feffer's statement is technically incomplete, even if not outright false.

d. Assessment District (AD) data is for monitoring, not design

Assessment District (AD) reports are meant to:

- track long-term trends,
- support maintenance decisions,
- and observe known landslide behavior

AD data is not intended to:

- define landslide geometry,
- establish failure mechanisms, or
- justify new development without independent, site-specific geologic modeling

Reliance on AD summary language misapplies the purpose of those reports.

6. GROUNDWATER UNCERTAINTY

Groundwater profiles used in Feffer's analyses do not represent the highest reasonably anticipated conditions, particularly given the proposed onsite wastewater system. Absent clear evidence of a laterally continuous groundwater barrier, groundwater should be assumed to form a continuous, slope-parallel surface.

It is well established from the history of landsliding in the Malibu Road area that the introduction or increase of water within a landslide mass can be a primary triggering mechanism, and under adverse conditions can prove devastating. Residents along Malibu Road recall that, around 1978, a residence located at 25325 Pacific Coast Hwy was lost during landslide activity and a substantial section of Malibu Road reportedly subsided on the order of approximately ten feet, a condition that remains evident today. These events occurred within living memory and underscore the sensitivity of the landslide complex to groundwater conditions.

Given this history, any increase in groundwater—whether from rainfall, altered drainage, or onsite wastewater disposal—must be conservatively evaluated with respect to both on-site and downslope stability.

7. MISSING PACIFIC SOILS DATA

Our report noted that Pacific Soils previously identified landslide terrain, although their logs are unavailable. Feffer's response did not address:

- What effort was made to find these logs?
- How missing data was considered in Feffer's uncertainty analysis
- Why earlier conclusions regarding landsliding were not incorporated conservatively given the lack of confirmatory logs
- Whether additional subsurface exploration is warranted to resolve this documented data gap

This omission leaves an unresolved question regarding the completeness of the site characterization.

Feffer should address if data is missing, make every effort to find these logs, whether there could be an underestimate of the likelihood of landsliding.

8. LANDSLIDE GEOMETRY IMPLICATIONS AND FAILURE SURFACE DEFINITION

As discussed above, the definition of landslide geometry presented by Feffer relies on incomplete subsurface data and selective use of instrumentation. When combined with missing or non-continuously logged boring information and the selective omission of inclinometer data from SI-5 and SI-6, the interpreted slide plane is artificially shallow.

Based on the geometry shown in Feffer's analyses, the slide surface is depicted as terminating above the depths at which movement has been documented in SI-5 and SI-6. However, if the documented displacement depths from SI-5 and SI-6 are incorporated into the geologic model, the slide plane necessarily projects significantly deeper and extends beneath the proposed project site.

Accordingly, omission of SI-5 and SI-6 from the geometric model, together with incomplete boring logs, results in an underestimation of slide depth, extent, and continuity. This materially affects slope stability calculations, pile embedment assumptions, and conclusions regarding both on-site and off-site stability.

9.0 DISMISSAL OF OLDER LANDSLIDE CONCLUSIONS WITHOUT TECHNICAL BASIS

Feffer's letter asserts that earlier consultants relied heavily on aerial photographs, but does not address:

- Aerial photos are but 1 form of data that is useful. This type of data. is very subjective as it relies, heavily on the professionals' view the photos. It is however, only a first cursory step and should not under any circumstance be used as tool in the definition of the subsurface geometry.
- Why multiple independent consultants identified similar landslide features over several decades
- Why the conservative interpretations contained in prior reports were not incorporated into the current model as stated in older reports.
- How Feffer's interpretation differs mechanically from older mapped configurations

As a result, Feffer's response does not adequately justify the departure from historical conclusions.

10.0 SHEAR STRENGTH SELECTION AND UNUSED LOWER RESIDUAL VALUES

Although Feffer outlines the basis of the shear strengths used, Feffer did not address:

- If the geometry is wrong, then any back calculated values will also be wrong

- The concern that strength values were averaged across borings, potentially obscuring weaker intervals
- Why the lowest residual value (8.5°), included in Feffer's own data set, was not used in translational analyses
- Whether user-defined failure planes—consistent with historic slide mapping—were evaluated with appropriate residual strengths

These items remain unresolved and directly affect factor-of-safety outcomes.

11.0 NEED FOR ADDITIONAL INSTRUMENTATION

Feffer's response does not address the recommendation for:

- A new inclinometer on the upper pad
- Monitoring through at least one wet winter to capture potential delayed movement

This recommendation remains outstanding and is consistent with CBC 1704A monitoring requirements for slope stability concerns.

Feffer's letter says only that the existing data shows no movement, but does not address:

- Why new instruments are or are not warranted
- Whether seasonal monitoring could reveal movement not previously captured

12.0 CY & ASSOCIATES' GEOLOGIC MISCHARACTERIZATION

Our report noted that CY & Associates did not correctly identify site geology. Feffer's response references CY's lack of landslide evidence but does not explain:

- Whether their geologic mischaracterization was corrected
- Whether Feffer's interpretation relied on or contradicted CY's assumptions

This point remains unaddressed.

13.0 LACK OF ANALYSIS OF COMPLEX SLIDE GEOMETRY

Feffer's response references both circular and translational analyses, but does not address:

- The absence of modeled compound or multi-surface failure configurations
- The reviewer's request for user-specified failure geometries based on mapped geologic features

1525 Pepper Tree Place, Fallbrook, CA 92028
TEL (760) 473-4117 Email Rnkjeffery@SBCGlobal.net

- Why deeper bedding-controlled surfaces suggested by previous investigations were not analyzed
- Most if not all of Stone sections show landsliding beneath the toe of slope and above the mapped active slide indicating that the slide is continuous through this area. Boring on the upper pad and below the pad shows. evidence of sliding. How is this explained given the depth involved.

This gap remains significant given the site's structural complexity.

14.0 PILE SYSTEM DEPTH AND ABILITY TO RESIST COMPLEX SLIDING

Although Feffer's letter reiterates support for the currently designed pile system, it does not respond to the specific concern that:

- The piles may not extend deep enough to intercept both upper and lower potential slide surfaces
- The design does not address compound or irregular failure geometries
- Revised pile embedment depths and tieback lengths may be required if lower residual strengths or deeper slide surfaces are considered

This remains a key unresolved engineering issue.

15.0 CONCLUSION

The geologic evaluation and the establishment of landslide geometry presented to date remain incomplete and do not adequately define the type, depth, continuity, or extent of landslide movement affecting the site and adjoining downslope properties. As a result, the slope stability analyses and subsequent engineering recommendations are based on an inaccurate or insufficient geological model and therefore cannot be reasonably relied upon. . The homeowners who are affected have good reasons to be concerned about the stability of the ground they are built on. This project represents an opportunity to enhance the stability of the slide complex and the lower homes, as well as providing a stable building site for the proposed development.

Given the potential for very heavy rains and subsequent increase in groundwater, utilizing an onsite wastewater system must be very carefully addressed. The above items represent significant technical questions that were not addressed or fully resolved in Feffer's response. We believe these issues warrant further evaluation, including additional subsurface exploration, review of inclinometer data, reevaluation of shear strengths, and reconsideration of the stabilization system's depth and configuration.

We remain available to discuss these matters and to review any supplemental analyses Feffer may wish to provide.

Commission Agenda Report

Planning Commission Meeting
01-20-26
Item 5.A.

To: Chair Riddick and Members of the Planning Commission

Prepared by: Richard Greenbauer, Contract Planner

Reviewed by: Joseph Smith, AICP, Contract Principal Planner

Approved by: Yolanda Bundy, MS, PE, CBO, CFCO, Community Development Director and Tyler Eaton, Assistant Community Development Director

Date prepared: January 8, 2026 Meeting date: January 20, 2026

Subject: Coastal Development Permit No. 25-032, Site Plan Review No. 25-039, and Demolition Permit No. 25-027 – An application to implement the Malibu Middle and High School (MMHS) Campus Specific Plan (Phases 2, 3a, and 4a) with the construction of a new two-story 18,911 square-foot middle school gym (Building D) and outdoor sports courts, one-story 9,243 square-foot middle school student activity, food service, and special education building with canopy (Building D/I), one-story 333 square foot broadcasting/media arts building (Building D), middle school quad and walkways, site improvements, landscaping, on-grade solar installation, grading, and underground utility work, including a site plan review for a height increase over 18 feet, not to exceed 36 feet as allowed in the MMHS Specific Plan and a demolition permit for the demolition of existing classroom Buildings K and I, seven portable classroom buildings, and one portable restroom building

Location: 30215 Morning View Drive, within the non-appealable coastal zone
APN: 4469-017-901
Owner: Santa Monica-Malibu Unified School District

RECOMMENDED ACTION: Adopt Planning Commission Resolution No. 26-04 (Attachment 1) certifying that the project is consistent with the Final Environmental Impact Report (EIR) (State Clearinghouse [SCH] No. 202008350), the Mitigation Monitoring and Reporting Program (MMRP), and the Statement of Overriding Considerations (SOC) adopted by the Santa Monica-Malibu Unified School District (SMMUSD) Board of

Education (Board) on January 26, 2022 and certified by the City Council on July 11, 2022 in Resolution No. 22-32, and approving Coastal Development Permit (CDP) No. 25-032, Site Plan Review (SPR) No. 25-039, and Demolition Permit (DP) No. 25-027 to implement the MMHS Campus Specific Plan (Specific Plan) (Phases 2, 3a, and 4a) with the construction of a new two-story 18,911 square-foot (sf) middle school gym (Building D) and outdoor sports courts, one-story 9,243 sf middle school student activity, food service, and special education building with canopy (Building D/I), one-story 333 sf broadcasting/media arts building (Building D), middle school quad and walkways, site improvements, landscaping, on-grade solar installation, grading, and underground utility work, including a site plan review for a height increase over 18 feet, not to exceed 36 feet as allowed in the MMHS Specific Plan and a demolition permit for the demolition of existing classroom Buildings K and I, seven portable classroom buildings, and one portable restroom building located in the Institutional Zone and MMHS Campus Specific Plan Overlay District at 30215 Morning View Drive (APN 4469-017-901) (SMMUSD).

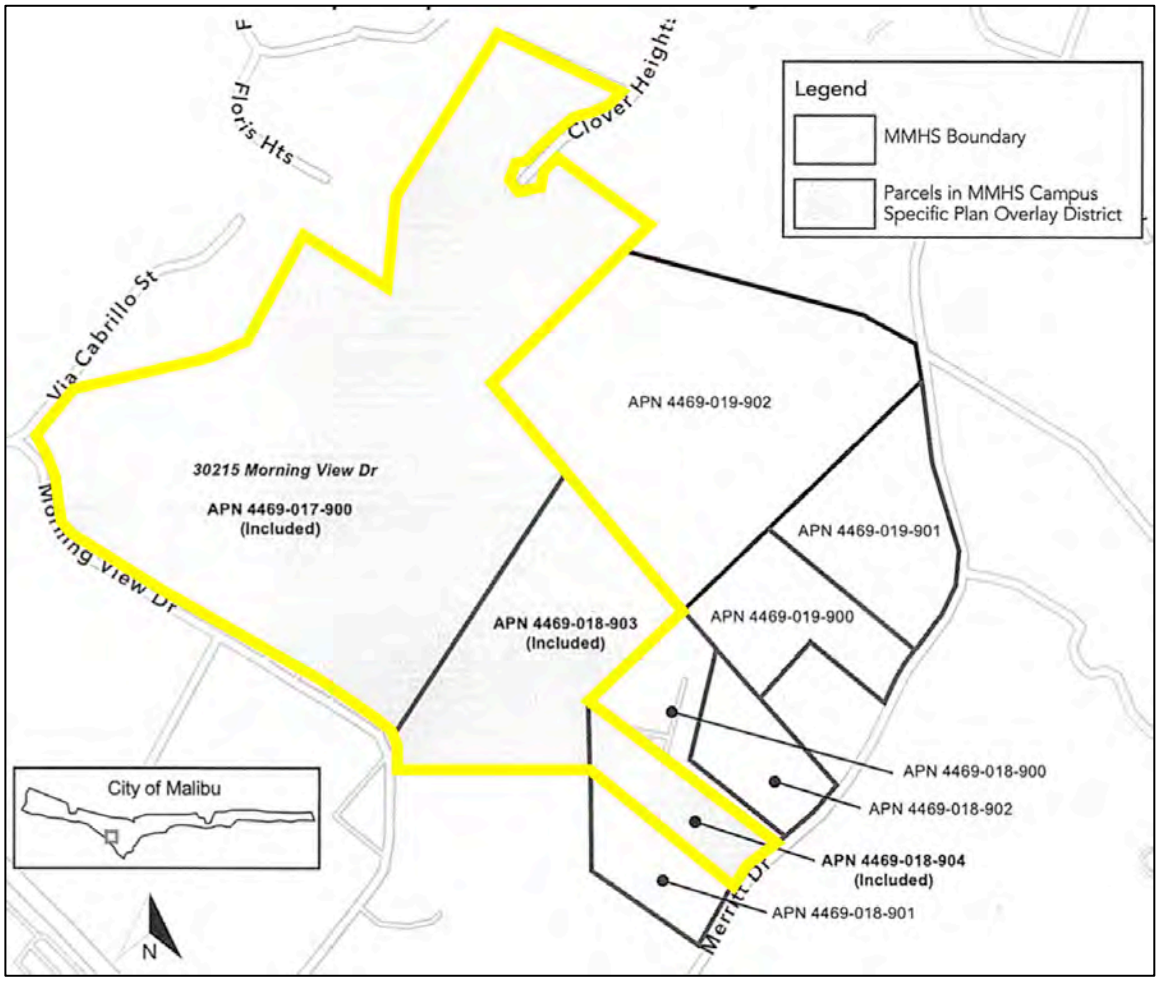
DISCUSSION: This agenda report provides a project overview, a summary of the surrounding land uses and project setting, a description of the proposed project, the Planning Division's analysis of the proposed project's consistency with the Specific Plan, Local Coastal Program (LCP), Malibu Municipal Code (MMC), and environmental review pursuant to the California Environmental Quality Act (CEQA). The analysis and findings contained herein demonstrate the proposed project is consistent with the LCP and MMC.

Surrounding Land Uses and Project Setting

The MMHS campus includes 86.69 acres in the Malibu Park neighborhood of west Malibu and is comprised of a high school, middle school, several outdoor sports fields and courts, support facilities, infrastructure, the Boys and Girls Club, the Malibu Equestrian Center, and approximately ten acres of undeveloped land. The MMHS campus is located on Morning View Drive, approximately one-quarter mile northeast of both Pacific Coast Highway (PCH) and Zuma Beach and generally between Merritt Drive to the west, Via Cabrillo Street to the east, and Harvester Road to the north. Residential properties are located north and west of the MMHS campus. The Malibu Equestrian Center is located east of developed campus area behind a large berm separating the equestrian use from the MMHS's main sports field. The Malibu United Methodist Church/Nursery School and residences along Morning View Drive are located south of the MMHS Campus. Figure 1 provides a vicinity aerial of the MMHS campus.

Figure 1 – Vicinity Aerial

Source: City GIS



Maximum topographic relief across the MMHS campus is approximately 94 feet, with elevations ranging from 86 feet above mean sea level near Morning View Drive to 180 feet in the north. There is limited natural vegetation onsite consisting primarily of grasses, ivy, brush, shrubs, and scattered trees, with some patches of disturbed and isolated coastal sage scrub in and around the main sports field. A blueline stream enters the MMHS campus in the northwest and flows under the property in a drainage pipe from Clover Heights Avenue to the west/southwest property line where it daylights into a natural streambed. Drainage from the MMHS campus flows overland and along parking lots and driveways in a southerly direction to Morning View Drive, where it collects into existing storm drains. The Phase 2, 3a, and 4a development areas are well outside of the natural vegetation area, stream, and stream setback area and not located within the CCC appeal jurisdiction.

Background Overview

In 2019, the District launched the specific plan process with the purpose of defining long-range facility goals that support the District's educational goals. A specific plan enables the classification and development of a parcel(s) of land as a coordinated, comprehensive project. The intent is to achieve a more desirable development or physical environment than would be possible through the strict application of conventional zoning regulations

and standards. The Specific Plan was eventually developed and illustrates a strategic vision for the MMHS campus over the next 10 to 15 years. On January 26, 2022, the District approved the Specific Plan, which established development standards and provided a framework for a cohesive redevelopment of the MMHS campus. Figure 2 delineates the parcels that comprised the MMHS campus at that time, with a yellow outline of the parcels associated with the Specific Plan. The Specific Plan area represents 49.46 acres of the overall 86.69 acre MMHS campus. Phase 1 approvals merged Assessor Parcel Numbers (APNs) 4469-017-900 and 4469-018-903 into the current APN 4469-017-901, which now represents the bulk of the campus.

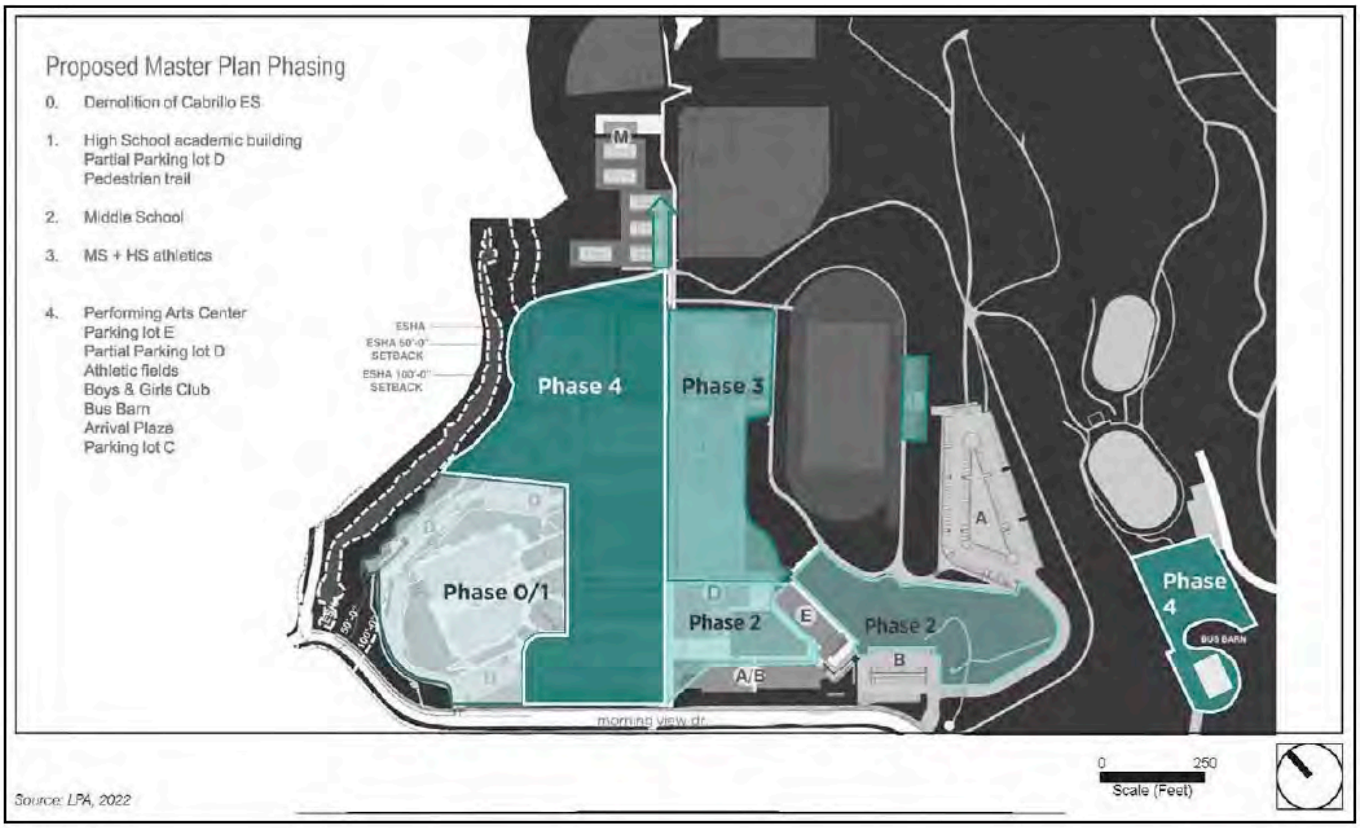


Figure 2 – Specific Plan

Source: City Ordinance 512

The Specific Plan includes four phases of development with completion anticipated in 2031. Figure 3 depicts the general area of each phase of development.

Figure 3 – Specific Plan Phasing

Source: Specific Plan

The following summarizes the main components of each phase. Due to construction efficiencies and logistics, the District may adjust some components with another phase.

- Phase 1 (Complete): Phase 1 included the demolition of all existing former Juan Cabrillo Elementary School (JCES) campus buildings, construction of Building C (high school classrooms, support services, and administration), Parking Lot C, Parking D, the Drop-off/Pick-up area, the after-the fact relocation of five portable buildings, restoration of Environmentally Sensitive Habitat Area (ESHA), and associated development.

- Phase 2 (Permitting): Phase 2 is the proposed scope of development as detailed under the Project Description section. Phase 2 includes the construction of Building D (middle school gym, student activities, and food services, as well as broadcast/media arts). Some components from Phases 3 and 4 were adjusted into Phase 2 by the District. This includes some grading, demolition of portable buildings, and the construction of a portion of planned Building I (special needs) into Building D. Construction is expected to occur over a two-year period.

- Phase 3 (Upcoming): Phase 3 would consist of the demolition of Buildings F and I, the existing field house, the construction of Buildings J (high school gym), L (shared aquatics center/field house), and M (shared upper field house), and Parking Lots E and F. Construction is expected to occur over a two-year period.

- Phase 4 (Upcoming): Phase 4 would involve the demolition of Buildings H, K, J, and J1, the pool and pool building, the bus barn, the demolition and/or relocation of the Boys & Girls Club, and construction of the new Building H (shared visual and performing arts) and the remaining portion of Building I (campus wellness). Construction is expected to occur over a one-year period.

This Specific Plan would result in the demolition of 18 existing buildings with only the existing athletic fields and recently completed Building A/B (Administration/Library) and Building E (middle school classrooms) to remain. Once completed, the Specific Plan would create dedicated spaces for Middle School and High School, resulting in a total of 54 classrooms, 12 labs, and 222,425 sf of building space at full Specific Plan buildout.

On August 8, 2022, the City Council approved the Specific Plan, which included an amendment to the LCP (LCPA). The LCPA was reviewed by the California Coastal Commission (CCC) on September 8, 2023 and conditionally certified with revisions. On October 23, 2023, the City Council adopted a revised LCP amendment. On November 17, 2023, the CCC Executive Director reported the City's adoption to the CCC and the City formally completed its final certification review of the LCPA. As of November 17, 2023, the Specific Plan is part of the City's LCP and used when conducting conformance reviews of all proposed development on the MMHS Campus. On September 5, 2023, the Planning Commission adopted Resolution No. 23-39 approving CDP No. 21-068 and implementing Phase 1.

Project Description

The District is proposing to move forward with Phase 2 which is focused on improvements to the middle school. To facilitate the development of Phase 2 and allow for efficiencies in construction, the District has included some demolition and development from later phases as part of the requested CDP. These components are referred to as Phases 3a and 4a. Figure 4 highlights the area of Phase 2, 3a, and 4a in red outline with green shading.

Figure 4 – Scope of Work Area

Source: City GIS

The proposed scope of work is described as follows:

Phase 2 scope:

- Two-story, 18,911 sf middle school gym (Building D) and reconfiguration of non-illuminated outdoor sports courts to meet emergency vehicle access (two full courts and two half courts);
- One-story 9,243 sf middle school student activity and food service building with a centralized steel canopy (Building D), referred to as the MS HUB. This building also integrates a special education component that was anticipated for Phase 4 as part of planned Building I;
- One-story 333 sf broadcasting/media arts building, referred to as the Main Distribution Framework (MDF) building (Building D);
- Middle school quad, walkways, stairways, and related site improvements;
- Fire lane for building access;
- Landscaping and fencing;
- On-grade solar installation with related components;
- Grading in the amount of 5,175 cubic yards (cy) of cut (including additional cut/fill

grading from the Phase 3a scope, total approximate grading for the proposed scope of work is 8,340 cy of cut, 4,303 cy of fill, and 4,037 cy designated for export).

- Underground utility work and connections to the wastewater treatment system.

Phase 3a scope:

- Demolition of a 4,561 sf classroom building (Building I);
- Demolition of seven 960 sf portable classrooms (6,720 sf total);
- Demolition of one 480 sf portable restroom; and
- Grading in the amount of approximately 3,165 cy cut and 4,303 cy fill (total grading reflected above in the Phase 2 scope).

Phase 4a scope:

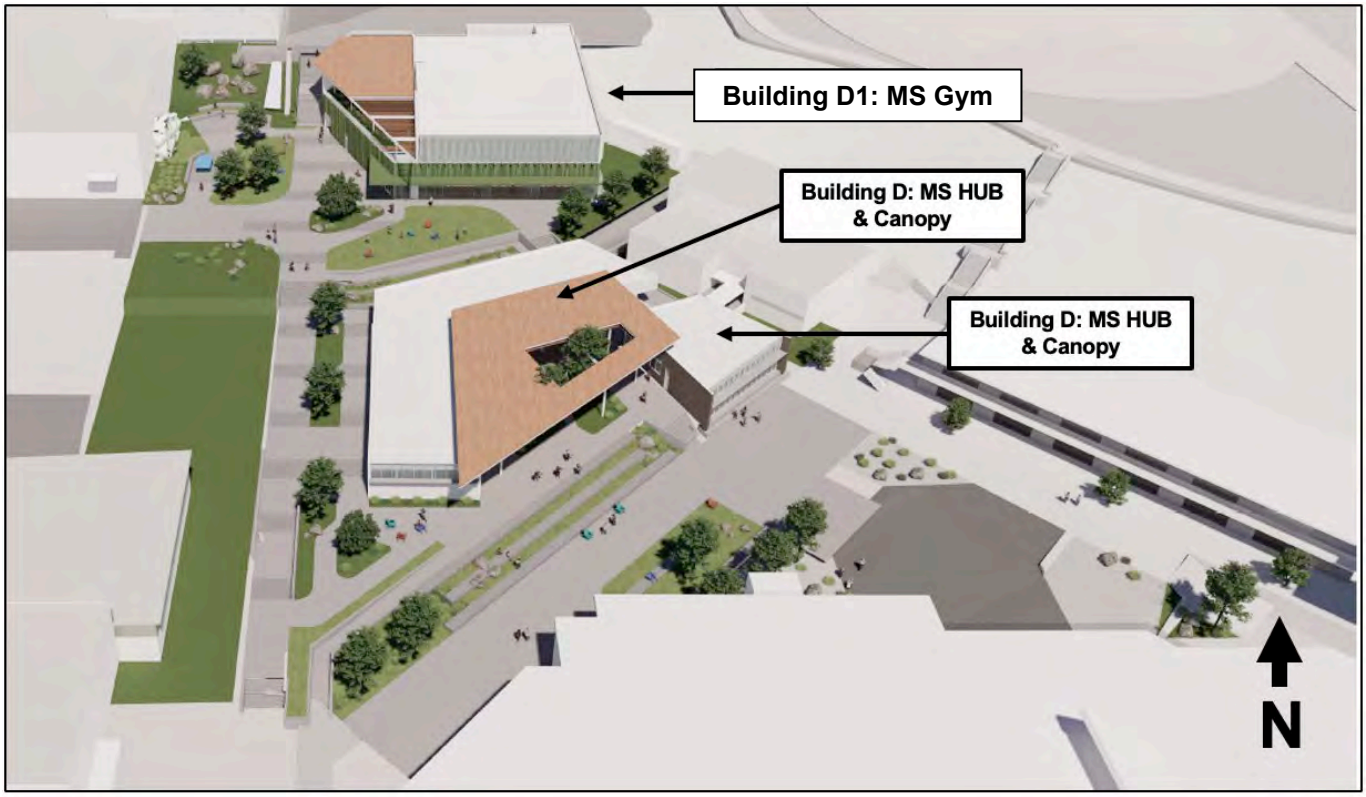
- Demolition of a 12,698-sf classroom building (Building K);
- Construction of the special education component (Building I) as part of Phase 2 Building D.

The proposed project includes two discretionary requests as summarized below:

1. SPR No. 25-039 for construction over 18 feet, up to a maximum height not to exceed 36 feet from finished grade as allowed in the Specific Plan for Building D. Additional components such as chimneys, rooftop antennas, and light standards may extend to 40 feet. As proposed, the components of Building D is split into three buildings with the maximum heights provided below. Per the Specific Plan, all heights are measured from finished grade.
    a. Building D Gym: 35 feet to top of parapet (rooftop solar <35 feet)
    b. Building D MS HUB: 17 feet
    c. Building D Canopy: 21 feet, 7 inches
    d. Building D MDF: 13 feet, 4 inches

2. DP No. 25-027 for the demolition of existing classroom Buildings I (4,561 sf) and K (12,698 sf), seven 960 sf portable classroom buildings (6,720 sf), one 480 sf portable restroom, and associated site development.

Other Approvals



Additional approvals are also required from the following agencies:

1. County of Los Angeles
    - Fire Department *(fire access and fire flow approved)*

- Water District 29 *(water service)*

2. State of California
   - Division of State Architect (DSA) *(approval of construction drawings and grading and building permits)*

Figure 5 – Proposed Building D & Grounds

LIP Conformance Analysis

The City Planning Division, City Biologist, City Environmental Health Administrator, City geotechnical consultant reviewers, City Public Works Department, Los Angeles County Fire Department (LACFD), and Los Angeles County Waterworks District No. 29 (WD29) reviewed the proposed project (Attachment 4 – Department Review Sheets). These specialists found the proposed project, as conditioned, is consistent with all applicable LCP codes, standards, goals and policies, with the inclusion of the requested SPR and subject to approval of the requested DP.

The LCP consists of a Land Use Plan (LUP) and LIP. The LUP contains programs and policies to implement the Coastal Act in the City. The purpose of the LIP is to carry out the policies of the LUP. The LIP contains specific policies and regulations to which every project requiring a CDP must adhere.

There are 14 LIP chapters that potentially apply depending on the nature and location of the proposed project. Of these, five are for conformance review only and contain no findings: 1) Zoning, 2) Grading, 3) Archaeological/Cultural Resources, 4) Water Quality, and 5) Onsite Wastewater Treatment System (OWTS). These chapters are discussed in the LIP Conformance Analysis section.

The nine remaining LIP chapters contain the required findings: 1) CDP; 2) ESHA; 3) Native Tree Protection; 4) Scenic, Visual and Hillside Resource Protection; 5) Transfer of Development Credits; 6) Hazards; 7) Shoreline and Bluff Development; 8) Public Access; and 9) Land Division. For the reasons described in this report, including the project site, the scope of work, and substantial evidence in the record, only findings in the following chapters are applicable to the proposed project: CDP (including the required findings for the SPR), and Hazards[1]. LIP Section 13.27.5(A) requires that the City make four findings in consideration and approval of a SPR. Five additional findings are required pursuant to MMC Section 17.62.040(D). The findings in MMC Section 17.70.060 also apply for the requested DP. These chapters are discussed in the LIP Findings section of this report. Additionally, the proposed project is subject to the Landscape Water Conservation Ordinance in MMC Chapter 17.53 as the project is proposing a new landscape area of 2,500 square feet or more.

Zoning (LIP Chapter 3)

While the MMHS campus is in the Institutional zone, the applicable development standards are provided in LIP Section 3.4.7(B) (MMHS Campus Specific Plan Overlay District) and 3.5 (General to All). This section states that the Institutional development standards in LIP Section 3.9 shall not apply. The applicable grading standards for development are provided in LIP Section 3.4.7(B)(6). This section states that the grading requirements of LIP Section 8.3(B) shall not apply.

Table 1 provides a summary of the lot dimensions and lot area of the subject parcel.

Table 1 – Property Data	
Lot Depth	2,030 ft
Lot Width	1,055 ft
Gross Lot Area	2,154,477 sf (49.46 ac)
Street Easement	0 sf
Area Comprised of 1:1 Slopes	12,196 sf
Net Lot Area	**2,142,281 sf (49.18 ac)**

[1] The ESHA, Native Tree Protection, Scenic, Visual and Hillside Resource Protection, Transfer of Development Credits, Shoreline and Bluff Development, Public Access, and Land Division findings are neither applicable nor required for the proposed project.

*Net Lot Area = Gross Lot Area minus the area of street easements and 1 to 1 slopes.

Table 2 summarizes the Specific Plan development standards and the project's consistency with each. Inclusive of the SPR request, the project is consistent with the applicable development standards.

Table 2 – Zoning Conformance			
Development Standard	**Allowed/Required**	**Proposed**	**Conformance**
SETBACKS (ft)			
Front Yard (from street easement)	10 ft	177 ft	Complies
Rear Yard (abuts residential zone)	304 ft	>700 ft	Complies
Side Yard (abuts residential zone)	105 ft	250 ft	Complies
ESHA	50[2] ft	125 ft	Complies
PARKING SPACES	322	389	Complies
FLOOR AREA RATIO (FAR) (sf)	0.15 (321,342 sf)	0.108[3] (28,487 sf)	Complies
HEIGHT (ft)	18ft or 36 ft with SPR (40 ft rooftop items)	Gym: 35 ft (<40 ft rooftop solar) MS HUB: 17 ft Canopy: 21 ft, 7 in MDF: 13 ft, 4 in	*SPR No. 21-003 (Specific Plan)*
NUMBER OF STORIES	2	Gym: 2 MS HUB: 1 MDF: 1	Complies
LANDSCAPING	25 percent minimum 535,570 sf	77.2 percent 1,653,841 sf	Complies
SITE PERMEABILITY	30 percent 642,675 sf	78 percent 1,662,624 sf	Complies
TOTAL GRADING (cy)	Phase 2: 5,175 cy (Cut: 5,175 cy) (Fill: 0 cy) Phase 3: 39,300 cy (Cut: 25,300 cy) (Fill: 14,000 cy)	Phase 2: 5,175 cy (Cut: 5,175 cy) (Fill: 0 cy) Phase 3: 7,468 cy (Cut: 3,165 cy) (Fill: 4,303 cy)	Complies (Specific Plan)

[2] The Specific Plan allows limited development to encroach in the 100-foot ESHA setback, but in no case can be closer than 50 feet. These limited improvements include drive aisles, permeable parking areas, fuel modification,
[3] FAR inclusive of existing Phase 1 and proposed development for Phases 2, 3a and 4a.

FENCE/WALL HEIGHT			
Retaining Walls	6 ft max, 12 ft cumulative	6 ft max, 0 ft cumulative	Complies
Front Yard			
Impermeable	42 in	None Proposed	Complies
Permeable	6 ft	None Proposed	Complies
Rear & Side Yard	6 ft	None Proposed	Complies

Table 3 provides a summary of MMHS campus size and the existing and proposed floor area ratio (FAR) for Phase 1:

Table 3: Floor Area Ratio Calculations		
Item	**Square Feet**	**FAR**
Net Lot Area	2,142,280 sf	.15 (maximum)
Existing MMHS Campus w/Phase 1 Completed	229,449 sf	.101
Proposed MMHS Campus w/ Phases 2, 3a, 4a	28,487 sf	.007
Total FAR with Proposed	257,936 sf	.108

Table 4 provides a summary of required parking per the City's LCP. Table 5 provides a summary of the existing and proposed parking inventory for the MMHS campus as a whole.

Table 4 – MMHS Required Parking Calculations		
Location	**Teaching stations**	**Parking Phase 2**
Buildings D and D1 (Proposed)	3	**4**
Malibu High School (Existing)	38	**266**
Malibu Middle School (Existing)	26	**52**
Total	67	**322**

Table 5 –MMHS Onsite Parking Tabulation		
Location / Parking Lot	**Existing**	**Parking Phase2**
150-Space Parking Lot (E) to Remain	150	**150 - No Change**
Lower Parking Lot (D) to Remain	59	**59 - No Change**
Student Parking Lot (A) to Remain	119	**119 - No Change**
Service Lots to be Removed	7	**0**
Parking Lot D (PH1 HS)	61	**61 - No Change**
Total	**396**	**389**

Lighting

Proposed exterior lighting for Buildings D1 (MS Gym) & D (MS HUB) would consist of low-intensity, full cut-off shielded light fixtures that maintain safe light levels while avoiding off-site lighting and night sky pollution, as required by the Specific Plan and MMC Chapter 17.41 (Dark Sky Ordinance). There will be no new sports field lighting developed as part of Phase 2, and no changes to the existing sports field lighting will occur. Lastly, all new Phase 2 lighting delineated as "night lighting" shall be shut off automatically at 11:00 p.m. as required by the Specific Plan. Security lighting will include motion sensors that extinguish lighting ten minutes after activation as required by the Specific Plan.

Grading (LIP Section 3.4.7(B)(6) and LIP Chapter 8)

The project site has varied topography within which the Special Education and Campus Wellness Center (identified as Building I in the Specific Plan) proposed for Phase 3 is being incorporated into Phase 2. The Phase 2 Project design results in two separate structures originally identified as Building D and orients them to the existing topography - minimizing grading and creating nuanced and varied outdoor spaces. The Middle School HUB Building completes the middle school quad, while the gymnasium building D1 is pulled away from Morning View Drive and setback behind the MS HUB to better mitigate its height, placing it near the existing high school gym and tucked into the terraced portion of the site.

The Specific Plan limits grading per phase of development pursuant to LIP Section 3.4.7(6), versus by acre pursuant to the general grading requirements in LIP Section 8.3(B). Table 6 summarizes the grading allowances for MMHS development by phase and the proposed grading included in Phase 2 and 3a:

Table 6 – MMHS Specific Plan Grading		
Phase	**Allowance**	**Proposed**
Phase 1	35,200 cy (cut) 10,400 cy (fill)	**Completed**
Phase 2	5,175 cy (cut) 0 cy (fill)	**5,175 cy (cut)** **0 cy (fill)**
Phase 3	25,300 cy (cut) 14,000 cy (fill)	**3,165 cy (cut)** **4,303 cy (fill)**
Phase 4	10,000 cy (cut) 33,350 cy (fill)	**0 cy (cut)** **0 cy (fill)**

The MMRP contains several mitigation measures to minimize potential impacts to traffic, noise, and air quality (Exhibit A to Attachment 1).

Further, the LIP limits the maximum height of cuts and fills with retaining walls to 6 feet in height for each wall, or 12 feet for any combination of walls, where a minimum 3-foot

separation exists between walls, except single cuts up to 12 feet in height which are an integral part of the structure are permitted. All proposed cuts and fills with retaining walls will not exceed 6 feet in height for any one wall and all proposed retaining walls conform to the existing topography of the site. With the allowances in the Specific Plan, the project complies with grading requirements set forth under LIP Section 3.4.7(B)(6) and LIP Chapter 8 as applicable.

Archaeological / Cultural Resources (LIP Chapter 11)

LIP Chapter 11 requires certain procedures be followed to determine potential impacts on archaeological resources. A Phase I Archaeological Survey was prepared by ECORP Consulting, Inc. for the subject property in August 2021. No indication of prehistoric or historic archaeological resources was discovered in the project area. ECORP Consulting, Inc. determined that any proposed improvements should have no adverse impacts to known cultural resources. Nevertheless, a condition of approval is included in the resolution which states that in the event that potentially important cultural resources are found in the course of geologic testing or during construction, work shall immediately cease until a qualified archaeologist can provide an evaluation of the nature and significance of the resources, and until the Community Development Director can review this information.

Water Quality (LIP Chapter 17)

The City Public Works Department reviewed and approved the proposed project for conformance to LIP Chapter 17 requirements for water quality protection and requirements of the State Water Resources Control Board because the property is located in an Area of Special Biological Significance (ASBS). The ocean between Latigo Point and the west City limits has been established by the State Water Resources Control Board as an ASBS as part of the California Ocean Plan. Standard conditions of approval include the implementation of approved storm water management plans during construction activities and to manage runoff from the development, including recordation of a water quality mitigation plan, and best management practices in compliance with ASBS standards. With the implementation of these conditions, the proposed project conforms to the water quality protection standards of LIP Chapter 17.

Wastewater Treatment System Standards (LIP Chapter 18)

LIP Chapter 18 addresses OWTS. LIP Section 18.7 includes specific siting, design, and performance requirements. On November 17, 2025, the SMMUSD amended CDP No. 21-068 to relocate a previously approved replacement OWTS. The replacement OWTS will serve the new MMHS campus buildings and consist of a 20,000-gallon Xerxes primary tank, 20,000- gallon Xerxes equalization tank, 5,000-gallong Xerxes grease interceptor, and four MicroSepTec Enviroserver ES25 treatment tanks housed in fiber glass reinforced plastic (FRP) tanks with effluent filters and ultraviolet disinfection systems. Effluent will be

disposed in six existing seepage pits. The existing OWTS components that will not be re-used for the new OWTS will be properly abandoned in place. The project to develop Phase 2, 3a, and 4a of the MMHS SP only involves connecting to the previously approved OWTS (CDP Amendment No. 24-005, Resolution No. 25-72). A conformance review of the proposed connection to the previously approved OWTS was completed by the City's Environmental Health Administrator on November 19, 2025. As part of that review, it was determined that the proposed project and connection to the previously approved OWTS was in conformance with LIP Section 18.7.

LIP Findings

A. Coastal Development Permit (LIP Chapter 13)

LIP Section 13.9 requires that the following four findings be made for all CDPs:

Finding 1. That the project as described in the application and accompanying materials, as modified by any conditions of approval, conforms with the certified City of Malibu Local Coastal Program.

The project is located completely within the Specific Plan area. The Planning Division, City Biologist, City geotechnical consultant reviewers, City Environmental Health Administrator, City Public Works Department, along with the LACFD and WD29 reviewed the project for conformance with the LCP. As discussed herein, based on submitted reports, project plans, visual analysis and site investigation, the project, as conditioned, was found to conform to the LCP in that it meets all applicable MMHS Specific Plan development standards. The build-out of Phases 2, 3a, and 4a achieves LIP Sections 1.2(D) and (G) (guides future growth and development), LIP Section 1.2(F) (promotes public health, safety, and general welfare) and LIP Section 1.2(K) (assures adequate public uses, facilities, and improvements).

Finding 2. If the project is located between the first public road and the sea, that the project is in conformity to the public access and recreation policies of Chapter 3 of the Coastal Act of 1976 (commencing with Sections 30200 of the Public Resources Code).

The project is not located between the first public road and the sea. There are no known or LCP-designated planned trails onsite. Therefore, no potential project-related or cumulative impact on public access is anticipated to result from the project. The project conforms to the public access and recreation policies of Chapter 3 of the Coastal Act of 1976 (commencing with Section 30200 of the Public Resources Code).

Finding 3. The project is the least environmentally damaging alternative.

There is no evidence that an alternative project would substantially lessen any potential significant adverse impacts of the development on the environment. The proposed project

is within the scope of the adopted EIR for the Specific Plan and does not require further environmental analysis. Phase 2, 3a, and 4a development of the Specific Plan were analyzed for design and site location/orientation within the existing developed area. However, the proposed area and design were determined to be the most suitable based on the operational and functional characteristics of the components on an active combined high school and middle school campus. Additionally, the location would be within the already disturbed and developed larger site area and would be integrated into the site's topography so that all development is clustered within an already developed campus. This ensures that the extent of development needed is minimized and that any existing public views of the ocean from the vicinity would remain and not be impeded. As such, the project has been determined to be the least environmentally damaging alternative.

Finding 4. If the project is located in or adjacent to an environmentally sensitive habitat area pursuant to Chapter 4 of the Malibu LIP (ESHA Overlay), that the project conforms with the recommendations of the Environmental Review Board, or if it does not conform with the recommendations, findings explaining why it is not feasible to take the recommended action.

The project site includes limited natural vegetation consisting primarily of grasses, ivy, brush, shrubs, and scattered trees, with some patches of disturbed and isolated coastal sage scrub in and around the main sports field (outside of the Phase 2, 3a, and 4a areas, including the location for the on-grade solar installation). A blueline stream enters the MMHS campus in the northwest and flows under the property in a drainage pipe from Clover Heights Avenue to the west/southwest property line where it daylights into a natural streambed. Drainage from the MMHS campus flows overland and along parking lots and driveways in a southerly direction to Morning View Drive, where it collects into existing storm drains. The Phase 2, 3a, and 4a development areas are well outside of the natural vegetation area, stream, and stream setback. Development is proposed approximately 125 feet at its closest point to ESHA and existing MMHS campus buildings serving the high school exist between the stream ESHA and proposed development area. Furthermore, Phases 2, 3a, and 4a components would be located within a previously disturbed and developed area of the MMHS campus. Utilization of the sloped area to the east of the middle school for the proposed on-grade solar installation is devoid of any sensitive habitat and would not result in any impacts to vegetation ESHA on or adjacent to the project site. Accordingly, the City Biologist determined on November 25, 2025 that review by the Environmental Review Board (ERB) is not required for the project.

B. Site Plan Review – Construction in Excess of 18 Feet in Height [LIP Section 13.27]

LIP Section 3.4.7.B.1 requires an SPR for height of structures over 18 feet, not to exceed 36 feet from finished grade as allowed in the Specific Plan for Building D. Additional components such as chimneys, rooftop antennas, and light standards may extend to 40 feet. Per the Specific Plan, all heights are measured from finished grade. As proposed,

the components of Building D are split into three buildings with the maximum heights provided as follows: Building D Gym: 35 feet (rooftop solar <40 feet), Building D MS HUB: 17 feet, Building D Canopy: 21 feet, 7 inches, and Building D MDF: 13 feet, 4 inches. LIP Section 13.27.5(A) requires that the City make four findings in consideration and approval of an SPR. Four additional findings are required pursuant to MMC Section 17.62.040(D) when a project exceeds 18 feet. Based on the foregoing evidence contained in the record, the required findings for SPR No. 25-039 are made as follows:

Finding 1. The project is consistent with policies and provisions of the Malibu LCP.

The Planning Division, City Biologist, City Environmental Health Administrator, City Public Works Department, City geotechnical consultant reviewers, WD29, and the LACFD reviewed the project for conformance with the LCP and found it to be consistent with the LCP, inclusive of the SPR.

Finding 2. The project does not adversely affect neighborhood character.

In October SMMUSD submitted a memorandum to the Community Development Director requesting that the Story Poles required per the Specific Plan be waived. After consideration and direction from staff, the request was modified to the use of balloons in lieu of Story Poles. Consistent with previous modifications to use balloons and to depict the proposed massing and bulk due to site constraints with existing site development and the fact that the campus is active with students and staff creating a potential hazard, the Community Development Director approved the use of balloons on November 10, 2025. This alternative to story poles was installed on December 19, 2025. Staff visited the project site on December 22, 2025, photo-documented the story pole balloons, and evaluated the project for conformance with City codes. (Attachment 5 – Modified Story Pole – Balloon Photos) The proposed Phase 2 buildings to replace existing buildings on site is consistent with the existing MMHS campus and surrounding developed neighborhoods as the proposed replacement structures are consistent with the Specific Plan and neighborhood properties in the vicinity will not be affected by the institutional development on the neighborhood character. The proposed placement of the new structures central to the larger campus and utilizing the angulating topography will result in a seamless integration into the site and will contribute to a decrease in building profile when viewed from offsite.

The proposed FAR of Phase 2, 3a, and 4a of .007 along with Phase 1 improvements would total 0.108 which does not exceed the maximum allowable FAR of 0.15 and has a design consistent with and compatible to the MMHS campus in regard to bulk and massing, and is consistent with the campus character envisioned in the Specific Plan. Based on the existing development pattern of the campus, the proposed project is expected to blend with the surrounding built environment. Therefore, the project will not adversely affect neighborhood character.

Finding 3. The project provides maximum feasible protection to significant public views as required by Chapter 6 of the Malibu LIP.

Staff visited the subject parcel after story pole balloons were installed. Based on staff's site visit, it was determined that the proposed Phase 2 structures would not be visible from public viewing areas as defined in the LIP and are appropriately embedded into the existing campus. Accordingly, the project is not expected to have significant impacts to scenic vistas and provides the maximum feasible protection to significant public views as required by LIP Chapter 6.

Finding 4. The proposed project complies with all applicable requirements of State and local law.

The project complies with all applicable requirements of the LCP. The Planning Division, City Biologist, City geotechnical consultant reviewers, City Environmental Health Administrator, City Public Works Department, along with the LACFD and WD29 reviewed the project for conformance with the LCP and it was found to be in conformance. The proposed project is regulated by the Division of State Architect-Structural Safety provisions within the current California Building Code (CCR Title 24, Part 2). Building plan check review and building permit issuance are not within the City's purview. Construction of the proposed improvements will comply with all building code requirements and will incorporate all recommendations from the Division of State Architect-Structural Safety.

Finding 5. The project is compatible with other development in the adjacent area in relation to size, bulk, and height.

The proposed two-story 35 foot tall Middle School Gym building D1 along with the single-story 17 foot tall Middle School Hub building D designed with two freestanding buildings connected via a 21 foot 7 inch tall steel canopy over the common area, are sited in the middle of the campus and utilize the existing terraced area to blend the proposed development into the larger school site. In addition, the proposed lower profile modern designed buildings bulk and massing would be screened by existing buildings on site as seen from off-site. The visual analysis provided by SMMUSD (Attachment 3 - MMHS Visual Analysis) indicate that although the proposed building would increase bulk and massing to this part of the campus, the development would be compatible with the existing development pattern in the area and consistent with the specific plan.

Finding 6. The portion of the project that is in excess of 18 feet in height does not obstruct visually impressive scenes of the Pacific Ocean, offshore islands, Santa Monica Mountains, canyons, valleys or ravines from the main viewing area of any affected principal residence as defined in MMC Section 17.40.040(A)(17).

Based on the visual impact analysis (aerial photographs, site visits and story pole balloon placement), staff has determined that the portions of the project above 18 feet in height

are not expected to obstruct visually impressive scenes of the Pacific Ocean, off-shore islands, Santa Monica Mountains, canyons, valleys, or ravines from the main viewing area of any affected principal residence as defined in MMC Section 17.40.040(A)(17). No nearby property owners have requested a primary view determination in response to the notice of application or story pole balloon installation. In addition, primary view determinations within the area were reviewed and are not expected to be impacted by the proposed development.

Finding 7. The project is consistent with the City's general plan, local coastal program, municipal code, and city standards.

The proposed project is consistent with the LCP in that the property is located in an area that has been identified and zoned for institutional uses, and in a location with a Specific Plan that was recently certified in 2023 by the CCC for inclusion in the City's LCP. The proposed project is also consistent with the City's General Plan. The goals and policies of the General Plan intend to maintain rural residential character in this area, and all components of the project are consistent with these goals. The proposed project is consistent with the LCP in that it conforms to the institutional land use designation and all applicable development standards contained within the Specific Plan inclusive of the SPR. In addition, proposed exterior lighting for the Middle School Hub and Middle School Gym would consist of low-intensity, full cut-off shielded light fixtures that maintain safe light levels while avoiding off-site lighting and night sky pollution, as required by the Specific Plan and the City of Malibu Dark Sky Ordinance.

Finding 8: The project does not affect solar access, as defined by staff.

Based on the visual impact analysis (aerial photographs, site visits and alternative story pole balloon placement), staff has determined that the portions of the proposed project in excess of 18 feet in height, coupled with the location central to the larger 49.6 acre site would not impact solar access to any properties off-site.

Finding 9: The project will not have a significant adverse impact on natural resources and makes suitable provisions for the preservation of natural hydrology, native plant materials, wooded areas, visually significant rock outcroppings, rough terrain, coastal bluffs and similar natural features.

The proposed Phase 2, 3a, and 4a project is located within the central portion of the MMHS campus in an area previously developed with temporary and permanent structures and the and demolition of existing buildings and construction of a new Middle School Gym, HUB, and MDF buildings along with the fact that no new development is planned within 125 feet of the ESHA on site, the project will not have a significant adverse impact on natural resources.

C. Environmentally Sensitive Habitat Area Overlay (LIP Chapter 4)

A biological assessment was prepared for the MMHS SP Phase 1 project by Psomas dated October 2021, due to the proximity and location of Phase 1 within and adjacent to ESHA. The Phase 2 development components were determined at that time to be substantially setback from the designated ESHA on site and all activities to construct Phases 2, 3a, and 4a would be over 627 feet away from vegetated ESHA and 125 feet from stream ESHA. Development would not encroach into any ESHA or the required 100-foot buffer. Therefore, the findings of LIP Chapter 4 are not applicable.

D. Native Tree Protection (LIP Chapter 5)

The provisions of the Native Tree Protection Chapter apply to those areas containing one or more native Oak, California Walnut, Western Sycamore, Alder or Toyon trees that have at least one trunk measuring six inches or more in diameter, or a combination of any two trunks measuring a total of eight inches or more in diameter, measured at 54 inches from the ground.

According to the Native Tree Report prepared for the Specific Plan area (Psomas 2021), the MMHS campus contains several native trees that require protection by the LCP's Native Tree Protection Ordinance. However, no protected trees are present in the Phase 2, 3a, and 4a project area. Nonetheless, the project has been conditioned to require the submittal of a construction management plan to ensure construction activities and staging avoid encroachment into the protected zones of protected trees. Therefore, the findings of LIP Chapter 5 are not applicable.

E. Scenic, Visual and Hillside Resource Protection (LIP Chapter 6)

The Scenic, Visual and Hillside Resource Protection Chapter governs those CDP applications concerning any parcel of land that is located along, within, provides views to or is visible from any scenic area, scenic road or public viewing area. Pursuant to LIP Section 6.4(A), written findings of fact, analysis and conclusions addressing scenic or visual resources must be included in support of all approvals, denials or conditional approvals of development located on a site or in an area where it is determined that the proposed project causes the potential to create adverse impacts upon scenic areas from or along scenic roads and public viewing areas. Staff analyzed potential view impacts associated with Phases 2, 3a, and 4a of the Specific Plan area via submitted view analysis photo documentation overlain with proposed and existing development on the MMHS site along with site visits and made the following determination. Phases 2, 3a, and 4a project components are all within a previously developed area and coupled with the topographic characteristics of the site, the proposed new structures are not anticipated to create visual impacts to visual resources. In addition, an alternative to story pole implementation utilizing balloons to establish the massing and height of the proposed development were

installed and staff further determined that no impacts to visual resources would occur. Therefore, the findings of LIP Chapter 7 are not applicable.

F. Transfer of Development Credit (LIP Chapter 7)

The project does not include a land division or multi-family development. Therefore, the findings of LIP Chapter 7 are not applicable.

G. Hazards (LIP Chapter 9)

Pursuant to LIP Section 9.3, written findings of fact, analysis and conclusions addressing geologic, flood and fire hazards, structural integrity or other potential hazards listed in LIP Sections 9.2(A)(1-7) must be included in support of all approvals, denials or conditional approvals of development located on a site or in an area where it is determined that the project causes the potential to create adverse impacts upon site stability or structural integrity.

The proposed development has been analyzed for the hazards listed in LIP Chapter 9 by the City Planning Division, City Biologist, City Environmental Health Administrator, City geotechnical consultant reviewers, City Public Works Department, the LACFD, and WD29. The geotechnical review conducted by the City for Phases 2, 3a, and 4a was for the planning-stage only to determine LCP conformance. The proposed project is regulated by the Division of State Architect-Structural Safety provisions within the current California Building Code (CCR Title 24, Part 2). Building plan check review and building permit issuance are not within the City's purview. The required findings are made as follows:

Finding 1. The project, as proposed will neither be subject to nor increase instability of the site or structural integrity from geologic, flood, or fire hazards due to project design, location on the site or other reasons.

A geotechnical report, OWTS design report, and civil plans were reviewed by the City's consultants from a geotechnical perspective. These reports are on file at City Hall. The reports evaluate site-specific conditions and recommendations are provided to address any pertinent issues. Potential hazards analyzed include geologic, seismic and fault rupture, liquefaction, landslide, groundwater, tsunami, and flood and fire hazards. It has been determined that the project is not located in a hazard zone, except that the project site is located within an extreme fire hazard area. Based on review of the project plans and associated geotechnical reports by the City Environmental Health Administrator, City Public Works Department, City geotechnical consultant reviewers, and the LACFD, these specialists determined that adverse impacts to the project site related to the proposed development are not expected. The proposed project will neither be subject to nor increase the instability from geologic, flood, or fire hazards. In summary, the proposed development is suitable for the intended use provided that the certified engineering geologist and/or geotechnical engineer's recommendations and governing agency's building codes are

followed. As such, the proposed project will not increase instability of the site or structural integrity from geologic, flood, or any other hazards.

Fire Hazard

The entire City of Malibu is designated as a Very High Fire Hazard Severity Zone, a zone defined by a more destructive behavior of fire and a greater probability of flames and embers threatening buildings. The subject property is currently subject to wildfire hazards. The scope of work proposed as part of this application is not expected to have an adverse impact on wildfire hazards. The proposed development may actually decrease the site's susceptibility to wildfire through compliance with fuel modification requirements and the use of appropriate building materials will be utilized during construction.

The City is served by the LACFD, as well as the California Department of Forestry, if needed. In the event of major fires, the County has "mutual aid agreements" with cities and counties throughout the State so that additional personnel and firefighting equipment can augment the LACFD. Conditions of approval have been included in the resolution to require compliance with all LACFD development standards. As such, the proposed project, as designed, constructed, and conditioned, will not be subject to nor increase the instability of the site or structural integrity involving wildfire hazards.

Finding 2. The project, as conditioned, will not have significant adverse impacts on site stability or structural integrity from geologic, flood or fire hazards due to required project modifications, landscaping or other conditions.

As stated in Finding 1, the project, as designed, conditioned and approved by the applicable departments and agencies, will not have any significant adverse impacts on the site stability or structural integrity from geologic or flood hazards due to project modifications, landscaping or other conditions.

Finding 3. The project, as proposed or as conditioned, is the least environmentally damaging alternative.

As previously stated in Section A, Finding 3, the project, as designed and conditioned, is the least environmentally damaging alternative.

Finding 4. There are no alternatives to development that would avoid or substantially lessen impacts on site stability or structural integrity.

The proposed development has been analyzed for the hazards listed in LIP Chapter 9 by the Planning Division, City Biologist, City geotechnical consultant reviewers, and the City Environmental Health Administrator. It has been determined that the project does not impact site stability or structural integrity. As previously discussed in Section A, Finding 3,

there are no feasible alternatives to development that would avoid or substantially lessen impacts on site stability or structural integrity beyond the proposed project.

Finding 5. Development in a specific location on the site may have adverse impacts but will eliminate, minimize or otherwise contribute to conformance to sensitive resource protection policies contained in the certified Malibu LCP.

As discussed in Section A, Finding 3, the project, as designed and conditioned, is the least environmentally damaging alternative and no adverse impacts to sensitive resources are anticipated.

H. Shoreline and Bluff Development (LIP Chapter 10)

The project site is not located on or along the shoreline, a coastal bluff or bluff top fronting the shoreline. Therefore, the findings of LIP Chapter 10 are not applicable.

I. Public Access (LIP Chapter 12)

LIP Section 12.4 requires public access for lateral, bluff-top, and vertical access near the ocean, trails, and recreational access for the following cases:

A. New development on any parcel or location specifically identified in the LUP or in the LCP zoning districts as appropriate for or containing a historically used or suitable public access trail or pathway.
B. New development between the nearest public roadway and the sea.
C. New development on any site where there is substantial evidence of a public right of access to or along the sea or public tidelands, a blufftop trail or an inland trail acquired through use or a public right of access through legislative authorization.
D. New development on any site where a trail, bluff top access or other recreational access is necessary to mitigate impacts of the development on public access where there is no feasible, less environmentally damaging, project alternative that would avoid impacts to public access.

As described herein, the subject property and the project do not meet any of these criteria in that no trails are identified on the LCP Park Lands Map on or adjacent to the property, and the property is not located between the first public road and the sea, or on a bluff or near a recreational area. The requirement for public access in LIP Section 12.4 does not apply and further findings are not required.

J. Land Division (LIP Chapter 15)

This project does not include the division of land. Therefore, the findings of LIP Chapter 15 are not applicable.

K. Demolition Permit (MMC Section 17.70)

MMC Section 17.70 states that a demolition permit shall be required for the demolition of any building or structure, or for a substantial remodel, except for a demolition initiated by the City and ordered or authorized under the provisions of the building code. The proposed project includes the demolition of existing classroom Buildings K and I, seven portable classrooms, one portable restroom, and associated development. The findings for DP No. 25-027 are made as follows.

Finding 1. The demolition permit is conditioned to assure that it will be conducted in a manner that will not create significant adverse environmental impacts.

Conditions of approval included for this application ensure that the project will not create significant adverse environmental impacts.

Finding 2. A development plan has been approved or the requirement waived by the city.

A CDP application is being processed concurrently with DP No. 25-027. Therefore, approval of the demolition permit is subject to the approval of CDP No. 25-032.

ENVIRONMENTAL REVIEW: In accordance with CEQA and CEQA Guidelines Section 15051 (SCH No. 202008350), the Board adopted a Final EIR for the MMHS Campus Specific Plan on January 26, 2022, which included all phases of development including the scope of work proposed in CDP No. 25-032. The EIR identified potential significant environmental impacts from the MMHS Campus Specific Plan but found that mitigation measures would reduce most impacts to less-than-significant levels. An MMRP was adopted for the project. The EIR also identified significant and unavoidable impacts on aesthetics (light and glare) and noise (sensitive receptors). The Board weighed the benefits of the project against the unavoidable impacts and determined that the benefits outweigh them. An SOC was adopted as part of the Final EIR. The Board, acting as the lead agency for the proposed project, consulted with responsible agencies, including the City, during the preparation of the EIR. On July 11, 2022, the City Council adopted Resolution No. 22-32 certifying the adequacy of the Final EIR. The Final EIR, MMRP, SOC, and accompanying materials are available on the City's website at: https://www.malibucity.org/397/Malibu-Middle-High-School-Improvements. As the decision-making body for CDP No. 25-032, the Planning Commission must review and consider the Final EIR before acting upon or approving the proposed Project.

The proposed scope of development was vetted for compliance with the Final EIR by the District, as lead agency, as part of its ongoing implementation of phase MMHS development. The District provided an overview of the environmental consistency it conducted (Attachment 6) wherein it was found that the proposed scope is within the parameters of the Final EIR as adopted by the Board on January 26, 2022. Pursuant to CEQA Guidelines Section, the District determined that no subsequent EIR was required

because the circumstances under which the scope of development will be undertaken would not substantially change such that new or more severe impacts would occur with implementing the proposed scope of development. Additionally, the District determined that no new initial study would be required per CEQA Guidelines section 15168(c)(1) because the scope of development would not have effects that were not otherwise examined in the Final EIR.

Pursuant to CEQA Guidelines Section 15162 and 15163, and based on the review of the entire record, including without limitation, the Final EIR, the Community Development Director finds that the proposed Project does not require further environmental review as: 1) no substantial changes are proposed to the Project and no substantial changes have occurred that require major revisions to the Final EIR due to the involvement of new significant environmental effects or an increase in severity of previously identified significant effects; and 2) no new information of substantial important has come to light that (a) shows the Project will have one or more significant effects not discussed in the Final EIR, (b) identifies significant impacts would not be more severe than those analyzed in the Final EIR, (c) shows that mitigation measures or alternatives are now feasible that were identified as infeasible and those mitigation measures or alternatives would reduce significant impacts, and (d) no changes or mitigation measures or alternatives have been identified or required. Pursuant to CEQA Guidelines Sections 15050(c), 15162(b), and 15163, the Community Development Director finds and recommends that no further environmental analysis or environmental documentation is necessary. Accordingly, the proposed Project is merely a step in furtherance of the MMHS Campus Specific Plan for which environmental review was performed and adopted by the Board, as lead agency, and further found that no supplemental or subsequent CEQA has been triggered for the proposed Project requiring additional environmental review.

PUBLIC NOTICE: Staff published a Notice of Public Hearing in a newspaper of general circulation within the City of Malibu on December 25, 2025, and mailed the notice to all property owners and occupants within a 500-foot radius of both subject properties (Attachment 7 – Public Hearing Notice).

CORRESPONDENCE: To date, the Planning Division has not received public comments regarding this application.

SUMMARY: The required findings can be made that the proposed project complies with the LCP including the Specific Plan and MMC. Further, the Planning Division's findings of fact are supported by substantial evidence in the record. Based on the analysis contained in this report and the accompanying resolution, the Planning Division recommends approval of this project, subject to the conditions of approval contained in Section 5 (Conditions of Approval) of Planning Commission Resolution No. 26-04. The proposed project has been reviewed and conditionally approved for conformance with the LCP by the Planning Division and appropriate City and County departments.

CITY OF MALIBU PLANNING COMMISSION
RESOLUTION NO. 26-04

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF MALIBU CERTIFYING THAT THE PROJECT IS CONSISTENT WITH THE FINAL ENVIRONMENTAL IMPACT REPORT (STATE CLEARINGHOUSE NO. 202008350), THE MITIGATION MONITORING AND REPORTING PROGRAM, AND THE STATEMENT OF OVERRIDING CONSIDERATIONS ADOPTED BY THE SANTA MONICA-MALIBU UNIFIED SCHOOL DISTRICT (SMMUSD) BOARD OF EDUCATION ON JANUARY 26, 2022 AND CERTIFIED BY THE MALIBU CITY COUNCIL ON JULY 11, 2022 IN RESOLUTION NO. 22-32, AND APPROVING COASTAL DEVELOPMENT PERMIT NO. 25-032, SITE PLAN REVIEW NO. 25-039, AND DEMOLITION PERMIT NO. 25-027 TO IMPLEMENT THE MALIBU MIDDLE AND HIGH SCHOOL (MMHS) CAMPUS SPECIFIC PLAN (PHASES 2, 3A, AND 4A) WITH THE CONSTRUCTION OF A NEW TWO-STORY 18,911 SQUARE-FOOT MIDDLE SCHOOL GYM (BUILDING D) AND OUTDOOR SPORTS COURTS, ONE-STORY 9,243 SQUARE-FOOT MIDDLE SCHOOL STUDENT ACTIVITY, FOOD SERVICE, AND SPECIAL EDUCATION BUILDING WITH CANOPY (BUILDING D/I), ONE-STORY 333 SQUARE FOOT BROADCASTING/MEDIA ARTS BUILDING (BUILDING D), MIDDLE SCHOOL QUAD AND WALKWAYS, SITE IMPROVEMENTS, LANDSCAPING, ON-GRADE SOLAR INSTALLATION, GRADING, AND UNDERGROUND UTILITY WORK, INCLUDING A SITE PLAN REVIEW FOR A HEIGHT INCREASE OVER 18 FEET, NOT TO EXCEED 36 FEET AS ALLOWED IN THE MMHS SPECIFIC PLAN AND A DEMOLITION PERMIT FOR THE DEMOLITION OF EXISTING CLASSROOM BUILDINGS K AND I, SEVEN PORTABLE CLASSROOM BUILDINGS, AND ONE PORTABLE RESTROOM BUILDING LOCATED IN THE INSTITUTIONAL ZONE AND MMHS CAMPUS SPECIFIC PLAN OVERLAY DISTRICT AT 30215 MORNING VIEW DRIVE (APN 4469-017-901) (SMMUSD)

The Planning Commission of the City of Malibu does hereby find, order and resolve as follows:

SECTION 1. Recitals.

A. On August 5, 2025, the Santa Monica-Malibu Unified School District (SMMUSD) submitted an application for a Coastal Development Permit (CDP) No. 25-032, Site Plan Review (SPR) No. 25-039, and Demolition Permit (DP) No. 25-027 to allow for the development of Phases 2, 3a, and 4a of the Malibu Middle and High School (MMHS) Campus Specific Plan (Specific Plan) which includes the following components: the construction of a new two-story 18,911 square-foot (sf) middle school gym (Building D) and outdoor sports courts, one-story 9,243 sf middle school student activity, food service, and special education building with canopy (Building D/I), one-story 333 sf broadcasting/media arts building (Building D), middle school quad and walkways, site improvements, landscaping, on-grade solar installation, grading, and underground utility work, including a site plan review for a height increase over 18 feet, not to exceed 36 feet as allowed in the Specific Plan and a demolition permit for the demolition of existing classroom Buildings K and I, seven portable classroom buildings, and one portable restroom building on the MMHS campus. The application was routed to the City Biologist, City Environmental Health Administrator, City geotechnical consultant reviewers, the City Public Works Department, Los Angeles County Fire Department (LACFD), and Los Angeles County Waterworks District No. 29 (WD29) for review.

B. On November 23, 2025, a Notice of Coastal Development Permit Application (CDP) was posted on the subject property.

C. On December 15, 2025 the application was deemed complete.

D. On December 22, 2025, Planning Division staff conducted a site visit to inspect the installed story poles as modified with balloons and representing the location, height, and bulk of the proposed buildings.

E. On December 25, 2025, a Notice of Planning Commission Public Hearing was published in a newspaper of general circulation within the City of Malibu and was mailed to all property owners and occupants within a 500-foot radius of the subject property.

F. On January 20, 2026, the Planning Commission held a duly noticed public hearing on the subject application, reviewed and considered the staff report, reviewed and considered written reports, public testimony, and other information in the record.

SECTION 2. Environmental Review.

In accordance with the California Environmental Quality Act (CEQA) and CEQA Guidelines Section 15051 (SCH No. 202008350), the SMMUSD Board of Education (Board), as Lead Agency, adopted a Final Environmental Impact Report (EIR) for the Specific Plan on January 26, 2022, which included all phases of development including the scope of work proposed in CDP No. 25-032. The Final EIR identified potential significant environmental impacts from the Specific Plan but found that mitigation measures would reduce most impacts to less-than-significant levels. A Mitigation Monitoring and Reporting Program (MMRP) was adopted for the project. The Final EIR also identified significant and unavoidable impacts on aesthetics (light and glare) and noise (sensitive receptors). The Board weighed the benefits of the project against the unavoidable impacts and determined that the benefits outweigh them. A Statement of Overriding Considerations (SOC) was adopted as part of the Final EIR. The Board, acting as the lead agency for the proposed project, consulted with responsible agencies, including the City, during the preparation of the EIR. On July 11, 2022, the City Council adopted Resolution No. 22-32 certifying the adequacy of the Final EIR. The Final EIR, MMRP, SOC, and accompanying materials are available on the City's website at: https://www.malibucity.org/397/Malibu-Middle-High-School-Improvements. As the decision-making body for CDP No. 25-032, the Planning Commission reviewed and considered the Final EIR before acting upon or approving the proposed Project.

The proposed scope of development was vetted for compliance with the Final EIR by the District, as lead agency, as part of its ongoing implementation of phase MMHS development. The District provided an overview of the environmental consistency it conducted (Attachment 6) wherein it was found that the proposed scope is within the parameters of the Final EIR as adopted by the Board on January 26, 2022. Pursuant to CEQA Guidelines Section, the District determined that no subsequent EIR was required because the circumstances under which the scope of development will be undertaken would not substantially change such that new or more severe impacts would occur with implementing the proposed scope of development. Additionally, the District determined that no new initial study would be required per CEQA Guidelines section 15168(c)(1) because the scope of development would not have effects that were not otherwise examined in the Final EIR.

Pursuant to CEQA Guidelines Section 15162 and 15163, and based on the review of the entire record, including without limitation, the Final EIR, the Planning Commission finds that the proposed Project does not require further environmental review as: 1) no substantial changes are proposed to the Project and no substantial changes have occurred that require major revisions to the Final EIR due to the involvement of new significant environmental effects or an increase in severity of previously identified significant effects; and 2) no new information of substantial important has come to light that (a) shows the Project will have one or more significant effects not discussed in the Final EIR, (b) identifies significant impacts would not be more severe than those analyzed in the Final EIR, (c) shows that mitigation measures or alternatives are now feasible that were identified as infeasible and those mitigation measures or alternatives would reduce significant impacts, and (d) no changes or mitigation measures or alternatives have been identified or required. Pursuant to CEQA Guidelines Sections 15050(c), 15162(b), and 15163, the Planning Commission finds and recommends that no further environmental analysis or environmental documentation is necessary. Accordingly, the proposed Project is merely a step in furtherance of the Specific Plan for which environmental review was performed and adopted by the Board, as lead agency, and further found that no supplemental or subsequent CEQA has been triggered for the proposed Project requiring additional environmental review.

SECTION 3. Coastal Development Permit Findings.

Based on evidence contained within the record, including the agenda report for the project and hearing on January 20, 2026, and pursuant to Local Coastal Program (LCP) Local Implementation Plan (LIP) including LIP Sections 13.7(B) and 13.9, and Malibu Municipal Code (MMC), the Planning Commission hereby adopts the findings in the agenda report and approves CDP No. 25-032, SPR No. 25-039, and DP No. 25-027 to allow the construction of a new two-story 18,911 sf middle school gym (Building D) and outdoor sports courts, one-story 9,243 sf middle school student activity, food service, and special education building with canopy (Building D/I), one-story 333 sf broadcasting/media arts building (Building D), middle school quad and walkways, site improvements, landscaping, on-grade solar installation, grading, and underground utility work, including an SPR for a height increase over 18 feet, not to exceed 36 feet as allowed in the Specific Plan and a DP for the demolition of existing classroom Buildings K and I, seven portable classroom buildings, and one portable restroom building on the MMHS campus.

The project is consistent with the LCP's zoning, grading, cultural resources, water quality, and wastewater treatment system standards requirements. With the inclusion of the SPR, the project, as conditioned, has been determined to be consistent with all applicable LCP and MMC codes, standards, goals, and policies. The required findings are made herein.

A. General Coastal Development Permit (LIP Chapter 13)

1. The project is located completely within the Specific Plan area. The Planning Division, City Biologist, City geotechnical consultant reviewers, City Environmental Health Administrator, City Public Works Department, along with the LACFD and WD29 reviewed the project for conformance with the LCP. As discussed herein, based on submitted reports, project plans, visual analysis and site investigation, the project, as conditioned, was found to conform to the LCP in that it meets all applicable MMHS Specific Plan development standards. The build-out of Phases 2, 3a, and 4a achieves LIP Sections 1.2(D) and (G) (guides future growth and development), LIP Section 1.2(F) (promotes public health, safety, and general welfare) and LIP Section 1.2(K) (assures adequate public uses, facilities, and improvements).

2. The project is not located between the first public road and the sea. There are no known or LCP-designated planned trails onsite. Therefore, no potential project-related or cumulative impact on public access is anticipated to result from the project. The project conforms to the public access and recreation policies of Chapter 3 of the Coastal Act of 1976 (commencing with Section 30200 of the Public Resources Code).

3. There is no evidence that an alternative project would substantially lessen any potential significant adverse impacts of the development on the environment. The proposed project is within the scope of the adopted EIR for the Specific Plan and does not require further environmental analysis. Phase 2, 3a, and 4a development of the Specific Plan were analyzed for design and site location/orientation within the existing developed area. However, the proposed area and design were determined to be the most suitable based on the operational and functional characteristics of the components on an active combined high school and middle school campus. Additionally, the location would be within the already disturbed and developed larger site area and would be integrated into the site's topography so that all development is clustered within an already development campus. This ensures that the extent of development needed is minimized and that any existing public views of the ocean from the vicinity would remain and not be impeded. As such, the project has been determined to be the least environmentally damaging alternative.

4. The project site includes limited natural vegetation consisting primarily of grasses, ivy, brush, shrubs, and scattered trees, with some patches of disturbed and isolated coastal sage scrub in and around the main sports field (outside of the Phases 2, 3a, and 4a areas, including the location for the on-grade solar installation). A blueline stream enters the MMHS campus in the northwest and flows under the property in a drainage pipe from Clover Heights Avenue to the west/southwest property line where it daylights into a natural streambed. Drainage from the MMHS campus flows overland and along parking lots and driveways in a southerly direction to Morning View Drive, where it collects into existing storm drains. The Phase 2, 3a, and 4a development area are well outside of the natural vegetation area, stream, and stream setback area. Development is proposed approximately 125 feet at its closest point to ESHA and existing MMHS campus buildings serving the high school exist between the stream ESHA and proposed development area. Furthermore, Phases 2, 3a, and 4a components would be located within a previously disturbed and developed area of the MMHS campus. Utilization of the sloped area to the east of the middle school for the proposed on-grade solar installation is devoid of any sensitive habitat and would not result in any impacts to vegetation ESHA on or adjacent to the project site. Accordingly, the City Biologist determined on November 25, 2025 that review by the Environmental Review Board (ERB) is not required for the project.

B. Site Plan Review – Construction in Excess of 18 Feet in Height [LIP Section 13.27]

1. The Planning Division, City Biologist, City Environmental Health Administrator, City Public Works Department, City geotechnical consultant reviewers, WD29, and the LACFD reviewed the project for conformance with the LCP and was found to be consistent with the LCP, inclusive of the SPR.

2. In October SMMUSD submitted a memorandum to the Community Development Director requesting that the Story Poles required per the Specific Plan be waived. After consideration and direction from staff, the request was modified to the use of balloons in lieu of Story Poles. Consistent with previous modifications to use balloons and to depict the proposed massing and bulk due to site constraints with existing site development and the fact that the campus is active with students and staff creating a potential hazard, the Community Development Director approved the use of balloons on November 10, 2025. This alternative to story poles was installed on December 19, 2025. Staff visited the project site on December 22, 2025, photo-documented the story pole balloons, and evaluated the project for conformance with City codes. The proposed Phase 2 buildings to replace existing buildings on site is consistent with the existing MMHS campus and surrounding developed neighborhoods as the proposed replacement structures are consistent with the Specific Plan and neighborhood properties in the vicinity will not be affected by the institutional development on the neighborhood character. The proposed placement of the new structures central to the larger campus and utilizing the angulating topography will result in a seamless integration into the site and will contribute to a decrease in building profile when viewed from offsite.

The proposed FAR of Phase 2, 3a, and 4a of .007 along with Phase 1 improvements would total 0.108 which does not exceed the maximum allowable FAR of 0.15 and has a design consistent with and compatible to the MMHS campus in regard to bulk and massing, and is consistent with the campus character envisioned in the Specific Plan. Based on the existing development pattern of the campus, the proposed project is expected to blend with the surrounding built environment. Therefore, the project will not adversely affect neighborhood character.

3. Staff visited the subject parcel after story pole balloons were installed. Based on staff's site visit, it was determined that the proposed Phase 2 structures would not be visible from public viewing areas as defined in the LIP and are appropriately embedded into the existing campus. Accordingly, the project is not expected to have significant impacts to scenic vistas and provides the maximum feasible protection to significant public views as required by LIP Chapter 6.

4. The project complies with all applicable requirements of the LCP. The Planning Division, City Biologist, City geotechnical consultant reviewers, City Environmental Health Administrator, City Public Works Department, along with the LACFD and WD29 reviewed the project for conformance with the LCP it was found to be in conformance. The proposed project is regulated by the Division of State Architect-Structural Safety provisions within the current California Building Code (CCR Title 24, Part 2). Building plan check review and building permit issuance are not within the City's purview. Construction of the proposed improvements will comply with all building code requirements and will incorporate all recommendations from the Division of State Architect-Structural Safety.

5. The proposed two-story 35 foot tall Middle School Gym building D1 along with the single-story 17 foot tall Middle School Hub building D designed with two freestanding buildings connected via a 21 foot 7 inch tall steel canopy over the common area are sited in the middle of the campus and utilize the existing terraced area to blend the proposed development into the larger school site. In addition, the proposed lower profile modern designed buildings bulk and massing would be screened by existing buildings on site as seen from off-site. The visual analysis provided by SMMUSD indicate that although the proposed building would increase bulk and massing to this part of the campus, the development would be compatible with the existing development pattern in the area and consistent with the specific plan.

6. Based on the visual impact analysis (aerial photographs, site visits and story pole balloon placement), staff has determined that the portions of the project above 18 feet in height are not expected to obstruct visually impressive scenes of the Pacific Ocean, off-shore islands, Santa Monica Mountains, canyons, valleys, or ravines from the main viewing area of any affected principal residence as defined in MMC Section 17.40.040(A)(17). No nearby property owners have requested a primary view determination in response to the notice of application or story pole balloon installation. In addition, primary view determinations within the area were reviewed and are not expected to be impacted by the proposed development.

7. The proposed project is consistent with the LCP in that the property is located in an area that has been identified and zoned for institutional uses, and in a location with a Specific Plan that was recently certified in 2023 by the CCC for inclusion in the City's LCP. The proposed project is also consistent with the City's General Plan. The goals and policies of the General Plan intend to maintain rural residential character in this area, and all components of the project are consistent with these goals. The proposed project is consistent with the LCP in that it conforms to the institutional land use designation and all applicable development standards contained within the Specific Plan inclusive of the SPR. In addition, proposed exterior lighting for the Middle School Hub and Middle School Gym would consist of low-intensity, full cut-off shielded light fixtures that maintain safe light levels while avoiding off-site lighting and night sky pollution, as required by the Specific Plan and the City of Malibu Dark Sky Ordinance.

8. Based on the visual impact analysis (aerial photographs, site visits and alternative story pole balloon placement), staff has determined that the portions of the proposed project in excess of 18 feet in height, coupled with the location central to the larger 49.6 acre site would not impact solar access to any properties off-site.

9. The proposed Phase 2, 3a, and 4a project is located within the central portion of the MMHS campus in an area previously developed with temporary and permanent structures and the and demolition of existing buildings and construction of a new Middle School Gym, HUB, and MDF buildings along with the fact that no new development is planned within 125 feet of the ESHA on site, the project will not have a significant adverse impact on natural resources.

C. Environmentally Sensitive Habitat Area Overlay (LIP Chapter 4)

1. The proposed project is consistent with all applicable provisions of the LCP in that the development is proposed outside of Environmentally Sensitive Habitat Areas. This project has been reviewed and approved by the City Biologist.

D. Hazards (LIP Chapter 9)

1. The record demonstrates that the project, as proposed and conditioned, the development will not adversely affect stability of the site or structural integrity from geologic, flood, or fire hazards in that the project complies with the recommended use of a pile foundation, is consistent with the recommended finish floor elevation, and requires that the certified engineering geologist and/or geotechnical engineer's recommendations and governing agency's building codes are followed.

2. The project as designed, conditioned, and approved by the City Geologist does not have any significant adverse impacts on the site stability or structural integrity from geologic, hazards due to the project design.

3. As previously discussed, the project, as proposed and conditioned, is the least environmentally damaging alternative as no significant impacts are expected.

4. There are no alternatives that would avoid or substantially lessen impacts on site stability or structural integrity.

5. No adverse impacts to sensitive resources are expected as the project complies with all development standards.

E. Demolition Permit Findings (MMC Chapter 17.70)

1. Conditions of approval, including the recycling of demolished materials, have been included to ensure that the proposed project will not create significant adverse environmental impacts.

2. Approval of the demolition permit is subject to the approval of CDP No. 25-032**.**

SECTION 4. Planning Commission Action.

Based on the foregoing findings and evidence contained within the record, the Planning Commission hereby approves CDP No. 25-032, SPR No. 25-039, and DP No. 25-027, subject to the following conditions.

SECTION 5. Conditions of Approval.

1. The property owners, and their successors in interest, shall indemnify and defend the City of Malibu and its officers, employees and agents from and against all liability and costs relating to the City's actions concerning this project, including (without limitation) any award of litigation expenses in favor of any person or entity who seeks to challenge the validity of any of the City's actions or decisions in connection with this project. The City shall have the sole right to choose its counsel and property owners shall reimburse the City's expenses incurred in its defense of any lawsuit challenging the City's actions concerning this project.

2. Approval of this application is to allow for the project described herein. The scope of work approved includes:

   Phase 2 scope:

   a. Two-story, 18,911 sf middle school gym (Building D) and outdoor sports courts (two full courts and two half courts);
   b. One-story 9,243 sf middle school student activity and food service building with a centralized steel canopy (Building D), referred to as the MS HUB. This building also integrates a special education component that was anticipated for Phase 4 as part of planned Building I;
   c. One-story 333 sf broadcasting/media arts building, referred to as the Main Distribution Framework (MDF) building (Building D);

d. Middle school quad, walkways, stairways, and related site improvements;
e. Fire lane for building access;
f. Landscaping and fencing;
g. On-grade solar installation with related components;
h. Grading in the amount of 5,175 cubic yards (cy) of cut (including additional cut/fill grading from the Phase 3a scope, total approximate grading for the proposed scope of work is 8,340 cy of cut, 4,303 cy of fill, and 3,837 cy designated for export).
i. Underground utility work and connections to the wastewater treatment system.

Phase 3a scope:

j. Demolition of a 4,561 sf classroom building (Building I);
k. Demolition of seven 960 sf portable classrooms (6,720 sf total);
l. Demolition of one 480 sf portable restroom; and
m. Grading in the amount of approximately 3,165 cy cut and 4,303 cy fill (total grading reflected above in the Phase 2 scope).

Phase 4a scope:

n. Demolition of a 12,698-sf classroom building (Building K);
o. Construction of the special education component (Building I) as part of Phase 2 Building D.

Discretionary Requests:

a. SPR No. 25-039 for construction over 18 feet up to a maximum height, not to exceed 36 feet from finished grade as allowed in the Specific Plan for Building D. Additional components such as chimneys, rooftop antennas, and light standards may extend to 40 feet. As proposed, the components of Building D is split into three buildings with the maximum heights provided below. Per the Specific Plan, all heights are measured from finished grade.
    i. Building D Gym: 35 feet (rooftop solar <40 feet)
    ii. Building D MS HUB: 17 feet
    iii. Building D Canopy: 21 feet, 7 inches
    iv. Building D MDF: 13 feet, 4 inches

b. DP No. 25-027 for the demolition of existing classroom Buildings I (4,561 sf) and K (12,698 sf), seven 960 sf portable classroom buildings (6,720 sf), one 480 sf portable restroom, and associated site development.

3. Except as specifically changed by conditions of approval, the proposed development shall be constructed in substantial conformance with the approved scope of work, as described in Condition No. 2 and depicted on the architectural and grading plans on file with the Planning Division date stamped **October 7, 2025**. The proposed development shall further comply with all conditions of approval stipulated in this resolution and Department Review Sheets attached hereto. In the event project plans conflict with any condition of approval, the condition shall take precedence.

4. Pursuant to LIP Section 13.18.2, this permit and rights conferred in this approval shall not be effective until the property owner signs, notarizes and returns the Acceptance of Conditions Affidavit accepting the conditions of approval set forth herein. The applicant

shall file this form with the Planning Division prior to the issuance of any development permits.

5. The applicant shall digitally submit a complete set of plans to the Planning Division for consistency review and approval prior to plan check and again prior to the issuance of any building or development permits.

6. The CDP shall expire if the project has not commenced within three (3) years after issuance of the permit, unless a time extension has been granted. Extension of the permit may be granted by the approving authority for due cause. Extensions shall be requested in writing by the applicant or authorized agent prior to expiration of the three-year period and shall set forth the reasons for the request. In the event of an appeal, the CDP shall expire if the project has not commenced within three years from the date the appeal is decided by the decision-making body or withdrawn by the appellant.

7. Any questions of intent or interpretation of any condition of approval will be resolved by the Community Development Director upon written request of such interpretation.

8. All development shall conform to requirements of the City Biologist, City Environmental Health Administrator, City geotechnical consultant reviewers, City Public Works Department, Los Angeles County Waterworks District No. 29 and LACFD, as applicable. Notwithstanding this review, all required permits shall be secured.

9. Minor changes to the approved plans or the conditions of approval may be approved by the Community Development Director, provided such changes achieve substantially the same results and the project is still in compliance with the Specific Plan, MMC, and the LCP. Revised plans reflecting the minor changes and additional fees shall be required.

10. Pursuant to LIP Section 13.20, development pursuant to an approved CDP shall not commence until the CDP is effective. The CDP is not effective until all appeals have been exhausted.

11. The property owner must submit payment for all outstanding fees payable to the City prior to issuance of any building permit, including grading or demolition.

Site Specific Conditions – MMRP Compliance

12. The project shall comply with all recommended mitigation measures listed in the Mitigation Monitoring and Reporting Program (MMRP) associated with the Final EIR, attached hereto as Exhibit A.

13. Prior to the commencement of work, a construction management plan, including a traffic control plan and construction parking plan, shall be submitted for review and approval by the Public Works Department and the Planning Division. The dedicated parking location for construction workers is prohibited within the public right of way.

Cultural Resources

14. In the event that potentially important cultural resources are found in the course of geologic testing or during construction, work shall immediately cease until a qualified archaeologist can provide an evaluation of the nature and significance of the resources and until the Community Development Director can review this information. Thereafter, the procedures contained in LIP Chapter 11 and those in MMC Section 17.54.040(D)(4)(b) shall be followed.

15. If human bone is discovered during geologic testing or during construction, work shall immediately cease and the procedures described in Section 7050.5 of the California Health and Safety Code shall be followed. Section 7050.5 requires notification of the coroner. If the coroner determines that the remains are those of a Native American, the applicant shall notify the Native American Heritage Commission by phone within 24 hours. Following notification of the Native American Heritage Commission, the procedures described in Section 5097.94 and Section 5097.98 of the California Public Resources Code shall be followed.

Lighting

16. Exterior lighting must comply with the Dark Sky Ordinance and shall be minimized, shielded, or concealed and restricted to low intensity features, so that no light source is directly visible from public view. Permitted lighting shall conform to the following standards:
    a. Lighting for walkways shall be limited to fixtures that do not exceed two feet in height and are directed downward, and limited to 850 lumens (equivalent to a 60-watt incandescent bulb);
    b. Security lighting controlled by motion detectors may be attached to the structure provided it is directed downward and is limited to 850 lumens;
    c. Driveway lighting shall be limited to the minimum lighting necessary for safe vehicular use. The lighting shall be limited to 850 lumens;
    d. Lights at entrances as required by the Building Code shall be permitted provided that such lighting does not exceed 850 lumens;
    e. Site perimeter lighting shall be prohibited; and
    f. Outdoor decorative lighting for aesthetic purposes is prohibited.

17. No permanently installed lighting shall blink, flash, or be of unusually high intensity or brightness. Lighting levels on any nearby property from artificial light sources on the subject property(ies) shall not produce an illumination level greater than one foot-candle.

18. Night lighting from exterior and interior sources shall be minimized. All exterior lighting shall be low intensity and shielded directed downward and inward so there is no offsite glare or lighting of natural habitat areas.

19. Motion sensor lights shall be programmed to extinguish ten minutes after activation.

20. Three violations of the conditions by the same property owner will result in a requirement to permanently remove the outdoor light fixture(s) from the site.

Demolition/Solid Waste

21. Prior to demolition activities, the applicant shall receive Planning Division approval for compliance with conditions of approval.

22. The applicant/property owner shall contract with a City approved hauler to facilitate the recycling of all recoverable/recyclable material. Recoverable material shall include but shall not be limited to: asphalt, dirt and earthen material, lumber, concrete, glass, metals, and drywall.

23. Prior to the issuance of a building/demolition permit, an Affidavit and Certification to implement waste reduction and recycling shall be signed by the Owner or Contractor and submitted to the Environmental Sustainability Division. The Affidavit shall indicate the agreement of the applicant to divert at least 65 percent (in accordance with CalGreen) of all construction waste from the landfill.

24. Dust control measures must be in place after the demolition is complete.

25. The project developer shall utilize licensed subcontractors and ensure that all asbestos-containing materials and lead-based paints encountered during demolition activities are removed, transported, and disposed of in full compliance with all applicable federal, state and local regulations.

26. Upon completion of demolition activities, the applicant shall request a final inspection by the Building Safety Division and the Planning Division.

Construction

27. Prior to the commencement of work, the applicant shall submit a copy of their Construction Management Plan to the Planning Division. The Construction Management Plan shall include a dedicated parking location for construction workers and storage of construction material, not within the public right of way. Prior to permit issuance, the Construction Management Plan must be acceptable to the Community Development Director and, if applicable, to the Building Official and Public Works Director.

28. A construction staging plan shall be reviewed and approved by the Community Development Director prior to plan check submittal.

29. Construction hours shall be limited to Monday through Friday from 7:00 a.m. to 7:00 p.m. and Saturdays from 8:00 a.m. to 5:00 p.m. No construction activities shall be permitted on Sundays or City-designated holidays.

30. For the transportation of heavy construction equipment and/or material, which requires the use of oversized-transport vehicles on State highways, the applicant / property owner is required to obtain a transportation permit from the California Department of Transportation.

Biology/Landscaping

31. Prior to installation of any landscaping, the applicant shall obtain a plumbing permit for the proposed irrigation system and provide a copy to the City Biologist.

32. Prior to or at the time of a Planning final inspection, the property owner/applicant shall submit to the case planner a copy of the plumbing permit for the irrigation system installation that has been signed off by the permitting agency.

33. Prior to final Planning inspection or other final project sign off (as applicable), the applicant shall submit to the Community Development Director for review and approval a certificate of completion in accordance with the Landscape Water Conservation Ordinance (MMC 17.53). The certificate shall include the property owner's signed acceptance of responsibility for maintaining the landscaping and irrigation in accordance with the approved plans and MMC 17.53. (form attached)

34. Prior to Final Plan Check Approval, if your property is serviced by the Los Angeles County Waterworks District No. 29, please provide a landscape water use approval from that department. For approval contact:

    LA County Waterworks District 29, 23533 Civic Center Way, Malibu, CA 90265, Phone: (310) 317-0209

    Note: submit plans through EPIC-LA using the "Waterworks Division Landscape Water Efficiency Approval" application. This action may require several weeks. As such, the applicant should submit their approved landscape plans as soon as feasible in order to avoid a delay at plan check.

35. Vegetation forming a view impermeable condition (hedge), serving the same function as a fence or wall, occurring within the side or rear yard setback shall be maintained at or below six feet in height. View impermeable hedges occurring within the front yard setback serving the same function as a fence or wall shall be maintained at or below 42 inches in height. Three sequential violations of this condition will result in a requirement to permanently remove the vegetation from the site.

36. Vegetation shall be situated on the property so as not to obstruct the primary view from private property at any given time (given consideration of its future growth).

37. Invasive plant species, as determined by the City of Malibu, are prohibited.

38. No vegetation is permitted within 5 feet of any structure.

39. No non-native plant species shall be approved greater than 50 feet from a structure.

40. The landscape plan shall prohibit the use of building materials treated with toxic compounds such as creosote and copper arsenate.

41. Grading/excavation/vegetation removal scheduled between February 1 - September 15 will require nesting bird surveys by a qualified biologist prior to initiation of such activities. Surveys shall be completed no more than five days from proposed initiation of site preparation activities. Should active nests be identified, a buffer area no less than 150 feet (300 feet for raptors) shall be fenced off until it is determined by a qualified biologist that the nest is no longer active. A report discussing the results of nesting bird surveys shall be submitted to the City within two business days of completing the surveys.

42. Night lighting from exterior and interior sources shall be minimized. All exterior lighting shall be low intensity and shielded so it is directed downward and inward so that there is no offsite glare or lighting of natural habitat areas. Up-lighting is prohibited.

43. Except as permitted pursuant to the provisions in LUP policies 3.18 and 3.20, throughout the City of Malibu, development that involves the use of pesticides, including insecticides, herbicides, rodenticides or any other similar toxic chemical substances, shall be prohibited in cases where the application of such substances would have the potential to significantly degrade Environmentally Sensitive Habitat Areas or coastal water quality or harm wildlife. Herbicides may be used for the eradication of invasive plant species or habitat restoration, but only if the use of non-chemical methods for prevention and management such as physical, mechanical, cultural, and biological controls are infeasible. Herbicides shall be restricted to the least toxic product and method, and to the maximum extent feasible, shall be biodegradable, derived from natural sources, and used for a limited time.

44. Demolition shall be scheduled only during the dry season from April 1 through October 31. If it becomes necessary to conduct earthmoving activities from November 1 through March 31, a comprehensive erosion control plan shall be submitted to the City Biologist for approval prior to the issuance of a grading permit and implemented prior to initiation of vegetation removal and/or earthmoving activities.

45. Prior to issuing a Certificate of Occupancy, the City Biologist shall inspect the project site and determine that all Planning conditions to protect natural resources are in compliance with the approved plans.

Grading/Drainage/Hydrology (Public Works)

46. Clearing and grading during the rainy season (extending from November 1 to March 31) shall be prohibited for development LIP Section 17.3.1 that:
    - Is located within or adjacent to ESHA, or
    - Includes grading on slopes greater than 4:1, or
    - Approved grading for development that is located within or adjacent to ESHA or on slopes greater than 4:1 shall not be undertaken unless there is sufficient time to complete grading operations before the rainy season. If grading operations are not completed before the rainy season begins, grading shall be halted and temporary erosion control measures shall be put into place to minimize erosion until grading resumes after March 31, unless the City determines that completion of grading would be more protective of resources.

47. Exported soil from a site shall be taken to the County Landfill or to a site with an active grading permit and the ability to accept the material in compliance with the City's LIP Section 8.3. A note shall be placed on the project that addresses this condition.

48. A grading and drainage plan shall be approved containing the following information prior to the issuance of grading permits for the project.
- Public Works Department general notes;
- The existing and proposed square footage of impervious coverage on the property shall be shown on the grading plan (including separate areas for buildings, driveways, walkways, parking, sports courts and pool decks);
- The limits of land to be disturbed during project development shall be delineated on the grading plan and a total area shall be shown on the plan. Areas disturbed by grading equipment beyond the limits of grading, areas disturbed for the installation of the septic system, and areas disturbed for the installation of the detention system shall be included within the area delineated;
- The grading limits shall include the temporary cuts made for retaining walls, buttresses, and over excavations for fill slopes and shall be shown on the grading plan;
- If the property contains trees that are to be protected they shall be highlighted on the grading plan.
- If the property contains rare and endangered species as identified in the resources study the grading plan shall contain a prominent note identifying the areas to be protected (to be left undisturbed). Fencing of these areas shall be delineated on the grading plan if required by the City Biologist.
- Private storm drain systems shall be shown on the grading plan. Systems greater than 12-inch diameter shall also have a plan and profile for the system included with the grading plan.
- Public storm drain modifications shown on the grading plan shall be approved by the Public Works Department prior to the issuance of the grading permit.

49. The ocean between Latigo Point and the west City limits has been established by the State Water Resources Control Board as an Area of Special Biological Significance (ASBS) as part of the California Ocean Plan. This designation prohibits the discharge of any waste, including stormwater runoff, directly into the ASBS. The applicant shall provide a drainage system that accomplishes the following:
- Installation of BMPs that are designed to treat the potential pollutants in the stormwater runoff so that it does not alter the natural ocean water quality. These pollutants include trash, oil and grease, metals, bacteria, nutrients, pesticides, herbicides and sediment.
- Prohibits the discharge of trash.
- Only discharges from existing storm drain outfalls are allowed. No new outfalls will be allowed. Any proposed or new storm water discharged shall be routed to existing storm drain outfalls and shall not result in any new contribution of waste to the ASBS (i.e., no additional pollutant loading).
- Elimination of non-storm water discharges.

50. A Local Storm Water Pollution Prevention Plan (LSWPPP) shall be provided prior to issuance of grading/building permits. This plan shall include and Erosion and Sediment Control Plan (ESCP) that includes, but not limited to:

Erosion Controls Scheduling	Hydraulic Mulch

	Hydroseeding
	Soil Binders
	Straw Mulch
	Geotextiles and Mats
	Wood Mulching
Sediment Controls	Fiber Rolls
	Gravel Bag Berm
	Street Sweeping and/or Vacuum
	Storm Drain Inlet Protection
	Scheduling
	Entrance/Exit Tire Wash
Non-Storm Water Management	Vehicle and Equipment Washing
	Vehicle and Equipment Fueling
	Vehicle and Equipment Maintenance
Waste Management	Material Delivery and Storage
	Spill Prevention and Control
	Solid Waste Management

All Best Management Practices (BMP) shall be in accordance to the latest version of the California Stormwater Quality Association (CASQA) BMP Handbook. Designated areas for the storage of construction materials, solid waste management, and portable toilets must not disrupt drainage patterns or subject the material to erosion by site runoff.

51. Prior to the approval of any permits and prior to the submittal of the required construction general permit document to the State Water Quality Control Board, the property owner / applicant shall submit the Public Works Department an Erosion and Sediment Control Plan (ESCP) for review. The ESCP shall contain appropriate site-specific construction site BMPs prepared and certified by a qualified SWPPP developer (QWD). All structural BMPs must be designed by a licensed California civil engineer. The ESCP must address the following elements:
    a. Methods to minimize the footprint of the disturbed area and to prevent soil compaction outside the disturbed area
    b. Methods used to protect native vegetation and trees
    c. Sediment / erosion control
    d. Controls to prevent tracking on- and off-site
    e. Non-stormwater control
    f. Material management (delivery and storage)
    g. Spill prevention and control
    h. Waste management
    i. Identification of site risk level as identified per the requirements in Appendix 1 of the Construction General Permit
    j. Landowner must sign the following statement on the ESCP:

    "I certify that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that quality personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information

submitted is true, accurate and complete. I am aware that submitting false and/or inaccurate information, failing to properly and/or adequately implement the ESCP may result in revocation of grading and/or other permits or other sanctions provided by law."

52. A State Construction activity permit is required for this project due to the disturbance of more than one acre of land for development. Provide a copy of the letter from the State Water Quality Control Board containing the WDID number prior to the issuance of grading or building permits.

53. Waste Discharge Requirements: Monitoring and reporting parameters required under MRP No. CI-10846 of the Waste Discharge Requirements by the Regional Water Quality Control Board (RWQCB) shall be submitted to the Los Angeles RWQCB on the effective date of coverage under the General WDRs.

54. A Storm Water Management Plan (SWMP) is required for this project. Storm drainage improvements are required to mitigate increased runoff generated by property development. The applicant shall have the choice of one method specified within the City's Local Implementation Plan Section 17.3.2.B.2. The SWMP shall be supported by a hydrology and hydraulic study that identifies all areas contributory to the property and an analysis of the predevelopment and post development drainage of the site. The SWMP shall identify the Site design and Source control Best Management Practices (BMP's) that have been implemented in the design of the project (See LIP Chapter 17 Appendix A). The SWMP shall be reviewed and approved by the Public Works Department prior to the issuance of the grading/building permits for this project.

55. A Water Quality Mitigation Plan (WQMP) is required for this project. The WQMP shall be supported by a hydrology and hydraulic study that identifies all areas contributory to the property and an analysis of the predevelopment and post development drainage of the site. The WQMP shall meet all the requirements of the City's current Municipal Separate Stormwater Sewer System (MS4) permit. The following elements shall be included within the WQMP:
    - Site Design Best Management Practices (BMP's)
    - Source Control BMP's
    - Treatment Control BMP's that retains on-site the Stormwater Quality Design Volume (SWQDv). Or where it is technical infeasible to retain on-site, the project must biofiltrate 1.5 times the SWQDv that is not retained on-site.
    - Drainage Improvements
    - A plan for the maintenance and monitoring of the proposed treatment BMPs for the expected life of the structure.
    - A copy of the WQMP shall be filed against the property to provide constructive notice to future property owners of their obligation to maintain the water quality measures installed during construction prior to the issuance of grading or building permits.
    - The WQMP shall be submitted to Public Works Department and the fee applicable at time of submittal for the review of the WQMP shall be paid prior to the start of the technical review. The WQMP shall be approved prior to the Public Works Department's approval of the grading and drainage plan and or building plans. The Public Works Department will tentatively approve the plan and will keep a copy until the completion of the project. Once the project is completed, the applicant shall verify the installation

of the BMP's, make any revisions to the WQMP, and resubmit to the Public Works Department for approval. The original signed and notarized document shall be recorded with the County Recorder. A copy of the WQMP shall be submitted to the Public Works Department prior to the certificate of occupancy.

56. The developer's consulting engineer shall sign the final plans prior to the issuance of permits.

57. The Division of State Architect may approve grading during the rainy season to remediate hazardous geologic conditions that endanger public health and safety.

Geology

58. All recommendations of the consulting certified engineering geologist or geotechnical engineer and/or the City geotechnical staff shall be incorporated into all final design and construction including foundations, grading, sewage disposal, and drainage. Final plans shall be reviewed and approved by the City geotechnical staff prior to the issuance of a grading permit.

59. Final plans approved by the City geotechnical staff shall be in substantial conformance with the approved CDP relative to construction, grading, sewage disposal and drainage. Any substantial changes may require a CDP amendment or a new CDP.

60. Plans should be revised to clarify whether the proposed grading is engineered grading, and appropriate grading specifications should be added to the plans.

61. If the proposed grading is engineered grading, then the updated grading plan shall be reviewed, signed and stamped by the Project Geotechnical Consultant as verification that the plan incorporates their grading and erosion control recommendations prepared for the overall project.

62. If engineered fills are placed during grading, an as-built compaction report documenting the limits of fill and test results should be prepared by the Project Geotechnical Consultant. Add the following note to the grading plans. "Prior to final approval of the project, an as-built compaction report prepared by the Project Geotechnical Consultant must be submitted to the City for review. The report must include the results of all density tests, a dry density and optimum moisture maximum curve(s), and a map depicting the limits of fill, locations of all density tests, locations and elevations of all removal bottoms. Geologic conditions exposed during grading must be depicted on an as-built geologic map."

Prior to Final Sign-Off

63. The applicant shall request a final Planning Division inspection prior to final inspection by the State Building Official. In addition, prior to the final inspection by the Planning Division, the applicant shall submit a copy of the final project plans demonstrating State approval. A final approval shall not be issued until the Planning Division has determined that the project complies with this CDP.

64. Any construction trailer, storage equipment or similar temporary equipment not permitted as part of the approved scope of work shall be removed prior to final inspection and approval by the Planning Division.

Deed Restriction

65. The property owner is required to execute and record a deed restriction which shall indemnify and hold harmless the City, its officers, agents, and employees against any and all claims, demands, damages, costs and expenses of liability arising out of the acquisition, design, construction, operation, maintenance, existence or failure of the permitted project in an area where an extraordinary potential for damage or destruction from wildfire exists as an inherent risk to life and property. The property owner shall provide a copy of the recorded document to the Planning Division prior to final planning approval. If this deed restriction was already recorded as part of a prior permit condition, evidence of the recorded document shall be provided to the Planning Division to satisfy this condition.

Fixed Conditions

66. This CDP shall run with the land and bind all future owners of the property.

67. Violation of any of the conditions of this approval may be cause for revocation of this permit and termination of all rights granted there under.

SECTION 6. The Planning Commission shall certify the adoption of this resolution.

PASSED, APPROVED AND ADOPTED this 20th day of January 2026.

ELIZABETH RIDDICK, Planning Commission Chair

ATTEST:

_____
REBECCA EVANS, Recording Secretary

LOCAL APPEAL Pursuant to Local Coastal Program Local Implementation Plan (LIP) Section 13.20.1 (Local Appeals) a decision made by the Planning Commission may be appealed to the City Council by an aggrieved person by written statement setting forth the grounds for appeal. An appeal shall be filed with the City Clerk within 10 days and shall be accompanied by an appeal form and filing fee, as specified by the City Council. Appeal forms may be found online at www.malibucity.org, in person at City Hall, or by calling (310) 456-2489, ext. 246.

Any action challenging the final decision of the City made as a result of the public hearing on this application must be filed within the time limits set forth in Section 1.12.010 of the MMC and Code of Civil Procedure. Any person wishing to challenge the above action in Superior Court may be limited to raising only those issues they or someone else raised at the public hearing, or in written correspondence delivered to the City of Malibu at or prior to the public hearing.

I CERTIFY THAT THE FOREGOING RESOLUTION NO. 26-04 was passed and adopted by the Planning Commission of the City of Malibu at the Regular meeting held on the 20th day of January 2026 by the following vote:

AYES:
NOES:
ABSTAIN:

Table 2-1 Mitigation Monitoring Requirements 16

1. Introduction

1.1 PURPOSE OF MITIGATION MONITORING PROGRAM

This Mitigation Monitoring Program has been developed to provide a vehicle by which to monitor mitigation measures and conditions of approval outlined in the Draft Environmental Impact Report (DEIR), State Clearinghouse No. 2020080350. The Mitigation Monitoring Program has been prepared in conformance with Section 21081.6 of the Public Resources Code and Santa Monica-Malibu Unified School District (SMMUSD or District) Monitoring Requirements. Section 21081.6 states:

> (a) When making findings required by paragraph (1) of subdivision (a) of Section 21081 or when adopting a mitigated negative declaration pursuant to paragraph (2) of subdivision (c) of Section 21080, the following requirements shall apply:
>
> (1) The public agency shall adopt a reporting or monitoring program for the changes made to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment. The reporting or monitoring program shall be designed to ensure compliance during project implementation. For those changes which have been required or incorporated into the project at the request of a responsible agency or a public agency having jurisdiction by law over natural resources affected by the project, that agency shall, if so requested by the lead or responsible agency, prepare and submit a proposed reporting or monitoring program.
>
> (b) The lead agency shall specify the location and custodian of the documents or other material which constitute the record of proceedings upon which its decision is based. A public agency shall provide that measures to mitigate or avoid significant effects on the environment are fully enforceable through permit conditions, agreements, or other measures. Conditions of project approval may be set forth in referenced documents which address required mitigation measures or, in the case of the adoption of a plan, policy, regulation, or other public project, by incorporating the mitigation measures into the plan, policy, regulation, or project design.
>
> (c) Prior to the close of the public review period for a draft environmental impact report or mitigated negative declaration, a responsible agency, or a public agency

2. Mitigation Monitoring Process

> having jurisdiction over natural resources affected by the project, shall either submit to the lead agency complete and detailed performance objectives for mitigation measures which would address the significant effects on the environment identified by the responsible agency or agency having jurisdiction over natural resources affected by the project, or refer the lead agency to appropriate, readily available guidelines or reference documents. Any mitigation measures submitted to a lead agency by a responsible agency or an agency having jurisdiction over natural resources affected by the project shall be limited to measures which mitigate impacts to resources which are subject to the statutory authority of, and definitions applicable to, that agency. Compliance or noncompliance by a responsible agency or agency having jurisdiction over natural resources affected by a project with that requirement shall not limit the authority of the responsible agency or agency having jurisdiction over natural resources affected by a project, or the authority of the lead agency, to approve, condition, or deny projects as provided by this division or any other provision of law.

The Mitigation Monitoring and Reporting Program (MMRP) will serve to document compliance with adopted/certified mitigation measures that are formulated to minimize impacts associated with development under the Malibu Middle and High School Campus Specific Plan Project (Proposed Project).

1.2 PROJECT LOCATION

The Santa Monica–Malibu Unified School District (SMMUSD or District) property is located at 30215 Morning View Drive (Assessor's Parcel Map Numbers (APN) 4469-017-900, 4469-018-900, 4469-018-901, 4469-018- 902, 4469-018-903, 4469-018-904, 4469-019-900, 4469-019-901, 4469-019-902) in the city of Malibu, Los Angeles County, California. The SMMUSD property consists of approximately 87 acres over nine parcels that includes the existing Malibu Equestrian Park in the eastern part of the property, the existing Malibu Middle and High School (MMHS) campus in the center, and the former Juan Cabrillo Elementary School (JCES) campus in the west (Project Site). The Project Site is situated on three of nine parcels: APN 4469-017-900 (40.06 acres), 4469-018-900 (9.4 acres), and 4459-018-904 (2.57 acres). The total acreage of the Project Site is 52.03 acres. The majority of the Malibu Middle and High School Campus Specific Plan Project (Proposed Project) would be developed within the existing MMHS campus and the former JCES campus, with one component of the Proposed Project in the Malibu Equestrian Park. The Project Site is set amid rolling hills, and its buildings and athletic fields are terraced into the hillside setting. The Project Site is in the City of Malibu Institutional (I) Zoning District that authorizes public educational institutions with a conditional use permit.

The Project Site is approximately 0.25-mile northeast of the Pacific Coast Highway (PCH) and Zuma Beach, and is bounded by Merritt Drive to the east, Via Cabrillo Street to the west, and Morning View Drive to the south. Single-family homes border the Project Site to the north.

2. Mitigation Monitoring Process

1.3 PROJECT SUMMARY

The Proposed Project would redevelop and modernize the existing MMHS campus and former JCES campus to create generally three separate and distinct areas: Middle School Core, High School Core, and shared facilities. Implementation of the Proposed Project would result in demolition of all 7 buildings and 9 portables on the former JCES campus and 6 buildings and associated amenities on the MMHS campus, totaling 154,904 square feet of demolition. The existing 25-meter lighted, outdoor pool complex would be demolished, and new 50- meter lighted, outdoor pool complex would be developed. The existing Building E and Buildings A/B at the Project Site would remain, and all other structures would be removed. No changes to the existing main football/track sports field, baseball, or softball fields would be made with the exception of minor improvements, including the development of new field houses and additional parking adjacent to the softball field. The Proposed Project would relocate the existing on-campus Bus Barn to a disturbed location on the adjacent, District-owned Malibu Equestrian Park. It would also include restoration in the campus-adjacent Environmentally Sensitive Habitat Area (ESHA) and establishment of a new trail along the ESHA that would connect to the existing, larger trail network around the campus. The Proposed Project would result in 32 classrooms, 8 labs and maker spaces, and support spaces—a total of 173,595 square feet of building space, providing the middle/high school campus with a total of 51 classrooms and 12 labs and a total of 222,425 square feet of building space.

1.1 ENVIRONMENTAL IMPACTS

1.1.1 Impacts Considered Less Than Significant

During preparation of the Initial Study, SMMUSD determined that four environmental impact categories would not be significantly affected by the proposed Malibu Middle and High School Campus Specific Plan Project. These categories are not discussed in detail in this DEIR.

- Agriculture and Forestry Resources
- Mineral Resources
- Population and Housing
- Tribal Cultural Resources

The DEIR determined that eight environmental factors would have less than significant impacts if the Proposed Project is implemented.

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials

2. Mitigation Monitoring Process

- Hydrology and Water Quality
- Land Use and Planning
- Noise
- Public Services
- Recreation
- Transportation
- Utilities and Service System
- Wildfire

1.1.2 Potentially Significant Adverse Impacts That Can Be Mitigated

The DEIR determined that seven environmental factors would have potentially significant impacts without mitigation.

- Air Quality
  - Construction-related pollutants
- Biological Resources
  - Impact to sensitive species
  - Loss of sensitive habitat types
  - Impact approximately 0.033 acres of USACE, RWQCB and CDFW Jurisdiction
  - Require compliance with the local tree ordinance
- Cultural Resources
  - Impacts on archaeological resources
- Geology and Soils
  - Hazards arising from off-site landslide, lateral spreading, subsidence, collapsible soils, or expansive soils
  - Impact to paleontological resources or unique geologic feature
- Noise
  - Permanent operation-related noise
- Transportation

2. Mitigation Monitoring Process

- Potentially hazardous conditions and potential conflicting uses

- Wildfire
  - Exacerbate wildfire risks
  - Exposure to risks, including downslope or downstream flooding or landslides

1.1.3 Unavoidable Significant Adverse Impacts

This DEIR identifies one significant and unavoidable adverse impacts, as defined by CEQA, that would result from implementation of the Proposed Project. Unavoidable adverse impacts may be considered significant on a project-specific, cumulatively significant, and/or potentially significant basis. If a project is determined to have a significant impact, the District must prepare a "statement of overriding considerations" before it can approve the project, where in the decision-making body must find and determine whether the benefits of the Proposed Project were balanced against the project's unavoidable significant environmental effects outweigh the adverse effects, and therefore the adverse effects are considered acceptable. The impact that was found in the DEIR to be significant and unavoidable is:

- Noise
  - Construction-generated noise

2. Monitoring and Reporting Requirements

2.1 MITIGATION MONITORING PROGRAM ORGANIZATION

CEQA requires that a reporting or monitoring program be adopted for the conditions of project approval that are necessary to mitigate or avoid significant effects on the environment (Pub. Resources Code, § 21081.6). The mitigation monitoring and reporting program is designed to ensure compliance with adopted mitigation measures during project implementation. For each mitigation measure recommended in the DEIR, specifications are made herein that identify the action required and the monitoring and reporting that must occur. In addition, a responsible agency is identified for verifying compliance with individual conditions of approval contained in the Mitigation Monitoring and Reporting Program. To effectively track and document the status of mitigation measures, a mitigation matrix has been prepared (see Table 2-1, *Mitigation Monitoring Requirements*).

2. Mitigation Monitoring Process

This page intentionally left blank.

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
5.1 AESTHETICS					
AES-1	To minimize spill lighting and glare impacts, all lighting from the Proposed Project, including from pool lighting, shall be LED, have full-cutoff shielding, be aimed specifically to direct areas.	Construction Contractor, Santa Monica-Malibu Unified School District	During design of each phase of the Project	Santa Monica-Malibu Unified School District City of Malibu	
AES-2	Atmospheric lighting pollution shall be reduced by using full cut-off shielded lighting fixtures that eliminate light directed to the sky. Marquee sign lighting shall be dimmable in the evenings when not required for student/community communication.	Construction Contractor, Santa Monica-Malibu Unified School District	During design of each phase of the Project	Santa Monica-Malibu Unified School District City of Malibu	
AES-3	Santa Monica-Malibu Unified School District (SMMUSD) shall minimize the effects of new sources of night lighting. Such measures, which may include the following and/or other measures, will be incorporated into each phase of the Proposed Project's design and operation: • All exterior lighting shall be delineated as either "night lighting" or "security lighting" and controlled by separate automatic timers. Lights delineated as security lighting shall be determined by the campus principal, security, and facility manager. • All lighting delineated as "night lighting" shall be shut off automatically at 10:00 p.m. on school nights. This includes pool lights. • When operation of "night lighting" is necessary after 10:00 p.m., SMMUSD as operator of the Project Site shall provide notice to the community by posting such notice on the campus website and the school message board and marquee. • When school is not in session (such as summer and winter break and weekends), "night lighting" shall not be permitted, and only required security lighting shall be illuminated.	Construction Contractor, Santa Monica-Malibu Unified School District	During design of each phase of the Project	Santa Monica-Malibu Unified School District City of Malibu	
AES-4	All structures shall incorporate nonreflective exterior building materials in their designs, and the use of reflective glass shall be prohibited.	Construction Contractor, Santa Monica-Malibu Unified School District	During design of each phase of the Project	Santa Monica-Malibu Unified School District City of Malibu	

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
AES-5	Pool and deck lighting shall comply with Malibu Dark Sky Ordinance. Pool lighting shall be turned off within ½ hour of aquatic use and the 2-foot candle safety perimeter lighting shall be turned off with all other automatic campus lighting.	Construction Contractor, Santa Monica-Malibu Unified School District	During design of the pool phase (before construction and operation)	Santa Monica-Malibu Unified School District City of Malibu	
5.2 AIR QUALITY					
AQ-1	Construction bids for Phase 1 through 4 activities at the Project Site shall specify use of offroad equipment that meets the United States Environmental Protection Agency (US EPA) Tier 4 interim emissions standards for off-road diesel-powered construction equipment with more than 50 horsepower, unless it can be demonstrated that such equipment is not available. In the event the equipment is not available, as demonstrated by the contractor, Tier 3 equipment retrofitted with a California Air Resources Board's Level 3 Verified Diesel Emissions Control Strategy (VDECS) shall be used. The following shall be specified in the construction bid: • Construction contractors shall use engines that meet US EPA Tier 4 Interim emission standards for equipment over 50 horsepower. • Construction contractors shall maintain a list of all operating equipment in use on the Project Site in use for more than 20 hours for verification by the District. The construction equipment list shall state the makes, models, and number of construction equipment on-site. • Construction contractors shall ensure that all equipment shall be properly serviced and maintained in accordance with the manufacturer's recommendations. • Construction contractors shall communicate with all sub-contractors in contracts and construction documents that all non-essential idling of construction equipment is restricted to five minutes or less in compliance with CARB Rule 2449. Construction contractors shall be responsible for	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
	ensuring that this requirement is met.				
5.3 BIOLOGICAL RESOURCES					
BIO-1	**Pre-Construction Burrowing Owl Surveys and Avoidance:** In the year prior to initiation of Proposed Project activities in Phase 4, and/or before recommencing construction activities if suspended/delayed for six months or more, a qualified biologist shall conduct pre-construction burrowing owl surveys in accordance with the 2012 CDFW Burrowing Owl Consortium Survey Protocol and Mitigation Guidelines (CDFW 2012). If wintering or breeding burrowing owl are observed adjacent to the impact area, mitigation shall be conducted in accordance with the CDFW guidelines (CDFW 2012).	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of Phase 4 of the Project	Santa Monica-Malibu Unified School District City of Malibu	
BIO-2	**Pre-Construction Nesting Bird Surveys:** To the extent possible, vegetation removal shall be conducted during the non-breeding season (i.e., September 1 to January 31) in order to minimize direct impacts on nesting birds and raptors. If construction activities would be initiated during the breeding season for nesting birds/raptors (i.e., February 1–August 31), a pre-construction survey will be conducted by a qualified Biologist within three days prior to the initiation of construction (including demolition of structures). If construction activities are delayed or suspended for more than 7 days during the breeding season, nesting bird surveys shall be repeated before construction activities can begin or restart. In addition, nesting bird surveys shall be conducted prior to starting phased Project construction and activities. The absence of nesting birds and raptors shall be considered valid only until the following breeding season. The area will be surveyed for 2 hours between dawn and 10:00 AM on five occasions with at least one week between surveys. If there is appropriate habitat for owls on site, on at least three of the surveys, surveys will also be conducted during the period immediately before nightfall. The nesting bird/raptor	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
	Survey Area will include a buffer of 300 feet around the work area for nesting birds and a buffer of 500 feet around the work area for nesting raptors (including burrowing owl). If the Biologist does not find any active nests in or immediately adjacent to the impact area, construction activities can proceed. If the Biologist detects an active nest within or immediately adjacent to the construction area and determines that the nest may be impacted or breeding activities substantially disrupted by increased activity around the nest, the Biologist shall determine an appropriate protective buffer around the nest depending on the sensitivity of the species and the nature of the construction activity. The protective buffer shall be between 25 to 300 feet for nesting birds; 300 to 500 feet for nesting raptors. The active nest will be protected within the designated buffer until nesting activity has ended. Any protective buffers will be mapped on construction plans and designated as "Environmentally Sensitive Areas". Construction can proceed within the protective buffer when the qualified Biologist has determined that the nest is no longer active (i.e., fledglings have left the nest or the nest has failed).				
BIO-3	**Vegetation Assessments:** Vegetation types shall be verified prior to work activities occurring in Phases 2 and 4 if seven years have elapsed from the latest point in time the vegetation mapping described in this Biological Assessment was conducted (April 15, 2021). Vegetation types in the BSA shall be assessed during a field visit and compared to the vegetation types mapped and described herein. Any changes shall be documented in a revised vegetation map and provided to the City of Malibu and the District. Special status vegetation types shall be identified, and if impacts are anticipated, the Proposed Project shall comply with Mitigation Measure, BIO-4.	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of Phases 2 and 4 of Project	Santa Monica-Malibu Unified School District City of Malibu	

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
BIO-4	**Special Status Vegetation Types:** The loss of special status vegetation types within the impact area is considered a significant impact. These vegetation types will be restored onsite or, if appropriate, offsite at a ratio of not less than 1:1, as agreed to by the City of Malibu and the District. A revegetation program shall be implemented in accordance with a City-approved landscape palette on all graded areas not utilized for improvements or structures. The revegetation program will be submitted to the City of Malibu for review and approval by a qualified biologist prior to issuance of grading permits. Restoration will consist of seeding and container planting of appropriate species. Impacts are considered less than significant after implementation of the following measures: A detailed restoration program will be developed prior to map recordation and implemented, and will contain the following items: • *Responsibilities and qualifications of the personnel to implement and supervise the plan.* The responsibilities of the landowner, specialists, and maintenance personnel that will supervise and implement the plan will be specified. • *Site selection.* The site(s) for mitigation will be determined in coordination with the District and the City of Malibu. The site will be located in a dedicated open space area and will be contiguous with other natural open space areas. • *Site preparation and planting implementation.* The site preparation will include the following: 1) protection of existing native species, 2) trash and weed removal, 3) native species salvage and reuse (i.e., duff), 4) soil treatments (i.e., imprinting, decompacting), 5) erosion control measures (i.e., rice or willow	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	

Table 2-1 Mitigation Monitoring Requirements

Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
wattles), and 6) native seed mix application. • *Schedule.* Establishment of restoration/revegetation sites will be conducted between October 1 and January 30. Seeding and planting of container plants will take place immediately after preparation of the restoration sites. • *Maintenance plan/guidelines*. The maintenance plan will include the following: 1) weed control, 2) herbivory control, 3) trash removal, 4) irrigation system maintenance, 5) maintenance training, and 6) replacement planting. • *Monitoring Plan.* The monitoring plan will include the following: 1) qualitative monitoring (i.e., photographs and general observations), 2) quantitative monitoring (i.e., randomly placed transects), 3) performance criteria as approved by the City, 4) monthly reports for the first year and bimonthly reports thereafter, and 5) annual reports which will be submitted to the City for three to five years. The monitoring will be conducted for three to five years, depending upon the performance of the mitigation site. • *Long-term preservation.* Long-term preservation of the site will be outlined in the conceptual mitigation plan to ensure the mitigation site is not impacted by future development. • *Performance standards will be identified and will apply for the revegetation of special status vegetation types.* Revegetation will be considered successful at three years if the percent cover and species diversity of the restored and/or created habitat areas are similar to percent cover and species diversity of adjacent existing habitats, as determined by quantitative testing of existing, restored, and created habitat areas.				

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
	In addition, earth-moving equipment will avoid maneuvering in areas outside the identified limits of grading in order to avoid disturbing open space areas that will remain undeveloped. Prior to grading, the construction boundary limits will be marked by the construction supervisor and the Project biologist. These limits will be identified on the grading plan. The District will submit a letter to the City of Malibu verifying that construction limits have been flagged in the field. No earth-moving equipment will be allowed outside of the construction boundary.				
BIO-5	**RWQCB and CDFW Jurisdiction Areas:** Upon completion of construction activities, impacts to approximately 0.033 acre of non-wetland RWQCB and CDFW jurisdictional waters will be mitigated within the Proposed Project boundaries at a minimum ratio (i.e., no less than) of 1:1 through the creation of 0.033 acre of non-wetland jurisdictional waters. Acquisition of a § 1602 "lake or streambed alteration" agreement from the CDFW and waste discharge requirements from the RWQCB would be required. Prior to the final submittal of a Report of Waste Discharge from the RWQCB, and/or CDFW notification of lake or streambed alteration, the District will develop a mitigation plan for the RWQCB, CDFW, and City of Malibu. The objective of the mitigation is to ensure no net loss of habitat values as a result of the Proposed Project. The detailed restoration program shall contain the following items: • *Responsibilities and qualifications of the personnel to implement and supervise the plan*. The responsibilities of the landowner, specialists and maintenance personnel that would supervise and implement the plan will be specified and shall include the demonstration of having successfully completed at least 3 mitigation projects of similar size and scope within the last 5 years including the design and implementation of an irrigation	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	

Table 2-1 Mitigation Monitoring Requirements

Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
system to ensure that the plantings and seeds are irrigated during periods of below average rainfall. The specialists that would supervise and implement the plan would include habitat restoration specialists, wildlife biologists, arborists, botanists, landscape contractor, and irrigation specialists. • *Site selection.* The site(s) for the mitigation will be determined in coordination with the Project Applicant and resource agencies. The site will be located in a dedicated open space area and will be contiguous with other natural open space. • *Site preparation and planting implementation.* The site preparation will include the following: 1) protection of existing native species, 2) trash and weed removal, 3) native species salvage and reuse (i.e., duff), 4) soil treatments (i.e., imprinting, decompacting), 5) temporary irrigation installation, 6) erosion control measures (i.e., rice or willow wattles), 7) native seed mix application, and 8) native container species. • *Schedule. A* schedule will be developed which includes planting and seeding to occur in late fall and early winter, between October 1 and January 30 in order to optimize the successful establishment and germination of native plants and seeds. • *Maintenance plan/guidelines.* The maintenance plan will include the following: 1) weed control, 2) herbivory control, 3) trash removal, 4) irrigation system maintenance, 5) maintenance training, and 6) replacement planting. • *Monitoring Plan.* The monitoring plan will include the following: 1) qualitative monitoring (i.e., photographs and general observations), 2) quantitative				

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
	monitoring (i.e., randomly placed transects), 3) performance criteria as approved by the resource agencies, 4) monthly reports for the first year and bimonthly reports thereafter, and 5) annual reports which will be submitted to the resource agencies for three to five years. Coordination will take place on a regular basis between the biological monitor, landscape contractor and irrigation specialist with regard to non-native species targeted for removal as well as irrigation schedule to ensure that the restoration in on track for achievement of performance criteria. In addition, remedial as well as contingency measures shall also be specified should the site not meet specified performance standards. The site will be monitored and maintained for five years to ensure successful establishment of riparian habitat within the restored and created areas; however, if there is successful coverage prior to five years, the District may request from RWQCB and CDFW to be released from monitoring requirements. • *Long-Term Preservation.* Long-term preservation of the site will be outlined in the conceptual mitigation plan to ensure the mitigation site is not impacted by future development. • Performance standards will be identified and will apply for the restoration of riparian habitat. Revegetation will be considered successful at three years if the percent cover and species diversity of the restored and/or created habitat areas are similar to percent cover and species diversity of adjacent existing habitats, as determined by quantitative testing of existing and restored and/or created habitat areas. The qualifications of the personnel to implement and supervise the plan				

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
	would include the demonstration of having successfully completed at least 3 mitigation projects of similar size and scope within the last 5 years including the design and implementation of an irrigation system to ensure that the plantings and seeds are irrigated during periods of below average rainfall. The specialists that would supervise and implement the plan would include habitat restoration specialists, wildlife biologists, arborists, botanists, landscape contractor, and irrigation specialists.				
BIO-6	**Adherence to City of Malibu Tree Protection Ordinance:** Prior to initiation of Proposed Project activities in each Phase of the Proposed Project, the tree survey map created for the Proposed Project (Appendix C) shall be consulted and if impacts to any protected trees are anticipated, the Proposed Project shall comply with mitigation included in the Malibu Local Coastal Program Native Tree Protection Ordinance.	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	
5.4. CULTURAL RESOURCES					
CUL-1	Prior to issuance of any permits allowing ground-disturbing activities for the Proposed Project (for each individual phase of the Project), the District shall ensure that an archaeologist who meets the Secretary of the Interior's standards for professional archaeology and a Qualified Paleontologist (or someone cross-trained in both areas) has been retained for the Project and will be on-call during all grading and other significant ground-disturbing activities. The Qualified Archaeologist and Paleontologist shall ensure that the following measures are followed for the Project: • Prior to any ground disturbance, the Qualified Archaeologist/Paleontologist, or their designee, shall provide worker environmental awareness protection training to construction personnel regarding regulatory requirements for the protection of	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	

Table 2-1 Mitigation Monitoring Requirements

Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)

cultural (prehistoric and historic) and paleontological resources. As part of this training, construction personnel shall be briefed on proper procedures to follow should unanticipated cultural or paleontological resources be made during construction.
• In the event that unanticipated cultural or fossil-bearing material is encountered during any phase of project construction, all construction work within 100 feet of the find shall cease and the Qualified Archaeologist/Paleontologist shall assess the find for importance. Construction activities may continue in other areas. If the discovery is determined to not be important by the Qualified Archaeologist/Paleontologist, work will be permitted to continue in the area.
  ◦ If a find is determined to be important by the Qualified Archaeologist/Paleontologist, he or she shall immediately notify the District. The District shall consult on a finding of eligibility and implement appropriate treatment measures if the find is determined to be eligible for inclusion in the California Register of Historical Resources (CRHR). Work may not resume within the no-work radius until the lead agencies, through consultation as appropriate, determine that the site either: (1) is not eligible for the CRHR; or (2) that the treatment measures have been completed to their satisfaction.
  ◦ If the find includes human remains, or remains that are potentially human, he or she shall ensure reasonable protection measures are taken to protect the discovery				

Table 2-1 Mitigation Monitoring Requirements

Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
from disturbance (Assembly Bill [AB] 2641). The archaeologist shall notify the Los Angeles County Medical Examiner-Coroner (as per § 7050.5 of the California Health and Safety Code). The provisions of § 7050.5 of the California Health and Safety Code, § 5097.98 of the California Public Resources Code (PRC), and AB 2641 will be implemented. If the Medical Examiner-Coroner determines the remains are Native American and not the result of a crime scene, the Medical Examiner-Coroner will notify the Native American Heritage Commission (NAHC), which then will designate a Native American Most Likely Descendant (MLD) for the Project (§ 5097.98 of the PRC). The designated MLD will have 48 hours from the time access to the property is granted to make recommendations concerning treatment of the remains. If the landowner does not agree with the recommendations of the MLD, the NAHC can mediate (§ 5097.94 of the PRC). If no agreement is reached, the landowner must rebury the remains where they will not be further disturbed (§ 5097.98 of the PRC). This will also include either recording the site with the NAHC or the appropriate information center; using an open space or conservation zoning designation or easement; or recording a reinternment document with the county in which the property is located (AB 2641). Work may not resume within the no-work radius until				

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
	the lead agencies, through consultation as appropriate, determine that the treatment measures have been completed to their satisfaction.				
5.6 GEOLOGY AND SOILS					
GEO-1	Design recommendations listed in the Geotechnical Report prepared for the Proposed Project shall be followed. These include, but are not limited to, seismic design parameters, foundation design, retaining wall, grading, trenching, etc. Details of these recommendations are included in Appendix H.	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	
GEO-2	Design recommendations regarding future irrigation systems identified in the Geotechnical Report shall be followed to ensure that irrigation shall not be allowed within at least 10-feet-horizontally around structures supported on shallow spread footings and/or with slabs-on-grade. Details of these recommendations are included in Appendix H.	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	
5.11 NOISE					
N-1	Construction contractors shall implement the following measures for construction activities conducted at the Project Site during each phase of construction. Construction plans submitted to the District shall identify these measures on demolition, grading, and construction plans. The District shall verify that grading, demolition, and/or construction plans submitted include these notations prior to demolition, grading, and/or building construction. • During the active construction period, equipment and trucks used for project construction shall utilize the best available noise control techniques (e.g., improved mufflers, intake silencers, ducts, engine enclosures, acoustically attenuating shields or shrouds) wherever feasible. • Impact tools (e.g., jack hammers and hoe rams) shall be hydraulic- or electric-powered wherever	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	

Table 2-1 Mitigation Monitoring Requirements

Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
feasible. Where the use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used along with external noise jackets on the tools. • Stationary equipment such as generators and air compressors shall be located as far as feasible from noise-sensitive uses. • The District's construction contractors and subcontractors shall be required through contract specifications to locate construction staging areas, construction worker parking, and material stockpiling as far away from vibration- and noise-sensitive sites as possible. Additionally, these activities shall be located away from occupied buildings on campus, occupied residential dwellings adjacent to the campus, and other sensitive receptors, where feasible. Prior to the start of construction activities, a sign shall be posted at the entrance(s) to the job site, clearly visible to the public, that includes permitted construction days and hours as well as the contact information of the District's and contractor's representatives who are authorized to respond in the event of a noise or vibration complaint. If the contractor's authorized representative receives a complaint, they shall investigate, take appropriate corrective action, and report the action to the District. • Signs shall be posted at the job site entrance(s), within the on-site construction zones, and along queueing lanes (if any) to reinforce the prohibition of unnecessary engine idling. All equipment shall be turned off if not in use for more than 5 minutes. • During the entire active construction period and to the extent feasible, the use of noise producing signals, including horns, whistles, alarms, and bells, shall				

Table 2-1 Mitigation Monitoring Requirements

Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
be for safety warning purposes only. The construction manager shall be responsible for adjusting alarms based on the background noise level, or to utilize human spotters when feasible and in compliance with all safety requirements and laws. • Notification shall be mailed to owners and occupants of all developed land uses immediately bordering or directly across the street from the Proposed Project Site providing a schedule for major construction activities through the duration of the construction period. When construction activity would occur within 100 feet of nearby receptor property lines, contractors shall erect temporary noise barriers where feasible. The temporary noise barrier shall have a minimum height of 12 feet and be free of gaps and holes. The barrier can be (a) a ¾-inch-thick plywood wall OR (b) a hanging acoustical blanket/curtain with a surface density or at least 1.5 pounds per square foot. • Prior to construction, the contractor shall submit to the District a list of equipment and activities required during construction to ensure proper planning of the most intense construction activities during time periods that would least impact campus operations. When construction activity would occur within 150 feet of active classrooms, contractors shall ensure that interior classroom noise levels do not exceed 50 dBA Leq. Feasible methods to achieve this include those listed above, scheduling work during less sensitive time periods when the classroom is not in use, and classroom use rescheduling to move active classes away from high noise construction activities, as necessary. Construction activities within 50 feet of occupied classrooms would be prohibited				

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
	during preparation and testing for National Standardized testing days of students at MMHS.				
N-2	The proposed bus barn shall be an enclosed structure constructed of wood, masonry, concrete, or other similar solid material (e.g., not corrugated metal). The structure will have no gaps and minimal window area. All bus testing shall be conducted inside the enclosed bus barn.	Construction Contractor, Santa Monica-Malibu Unified School District	During design of the relocated bus barn	Santa Monica-Malibu Unified School District City of Malibu	
5.14 TRANSPORTATION					
T-1	During each phase of construction activity, SMMUSD shall work with the City of Malibu Public Works Department to develop and implement a Construction Traffic Mitigation Plan that is specific to the needs of each phase and shall include the following: • Haul trucks and vendor truck traffic ingress and egress to/from the construction area shall not occur 30 minutes before or after student arrival and dismissal times—8:30 am Monday through Friday, 1 pm to 3 pm Monday through Thursday, and 12 pm to 1:30 pm on Friday. • The plan shall eliminate curbside parking on the south side of Morning View Drive south of the construction staging area to provide adequate turn radius and site distance to access for trucks entering and leaving work sites. This would apply to construction Phases 1, 2, and 3 only, which would have access via the segment of Morning View Drive adjacent to the school frontage. • The plan shall include a Traffic Education Program to assist in educating parents, students, and staff on drop-off/pick-up procedures specific to each phase of construction. Informational materials shall be disseminated regarding student drop-off and pick-up procedures via regular parent/school communication methods and shall be posted on the school website.	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
	• The use of portable message signs and information signs at construction sites shall be employed as needed. • Construction activities for each phase shall be coordinated with the responsible agency departments, including the City of Malibu Public Works and Planning Departments, and the Los Angeles County Sheriff and Fire Departments no less than 10 days prior to the start of the work for each phase. Notification shall specify whether any temporary vehicle, pedestrian, or bicycle construction detours are needed, if construction work would encroach into the public right-of-way, or if temporary use of public streets surrounding the Project Site is needed.				
T-2	To facilitate safe and efficient vehicular and pedestrian circulation during student drop-off and pickup, times during Phase 1, prior to initiation of construction activities, SMMUSD shall work with the City of Malibu Public Works Department to develop and implement a Traffic and Parking C Plan to include the following: • Designation of vehicular drop-off and pick-up areas outside Morning View Drive at off-street Parking Lots A, D, and E. Vehicular access to these lots shall allow vehicles to enter and return from the area from the intersection of Morning View Drive at PCH. • Student drop-off and pick-up shall be implemented in a counterclockwise circulation pattern. Figure 7 (see Appendix L) depicts vehicular circulation patterns that shall be used in Parking Lots A, D, and E during Phase 1 construction. • If needed, construction traffic can be restricted to ensure that most construction trips occur outside of the drop-off and pick-up periods.	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
	• The school shall educate students and parents on drop-off and pick-up routes and procedures. This may be achieved with a combination of information bulletins shared with students and parents.				
T-3	Construction scheduling during Phases 2 to 4 shall be scheduled such that any activities that would result in potential lane closures along Morning View Drive, including, but not limited to, reconstruction of the student drop-off/pick-up area and sidewalks along Morning View Drive, shall be limited to summer months when school is not in session to eliminate conflicts with local traffic and pedestrian activities.	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of Phases 2 and 4 of Project	Santa Monica-Malibu Unified School District City of Malibu	
T-4	The SMMUSD shall coordinate with the City of Malibu Public Works Department to relocate crosswalks and school-area signage in relation to the proposed access driveways according to City of Malibu and applicable State criteria. Crossing guards shall be relocated as necessary, based on the ultimate location of crosswalks.	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District	
T-5	Drop-off and pick-up during Phases 2 to 4 can take place in the newly constructed drop-off and pick-up areas in Parking Lots C and D. The school can continue to use Parking Lots B and the Parking Lots D and E that will be implemented in Phase 1. During Phases 2 to 4, the following mitigation measures would be required to ensure proper circulation is provided: o Haul trucks and vendor truck traffic ingress and egress to/from the construction area shall not occur during the drop-off/pick-up hours of 7:00 to 9:00 AM and 2:30 to 4:30 PM.	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	
T-6	Each coastal development permit application required to implement Phases 2 – 4 must include traffic impact analyses to reflect the most recent student population projections. In the event the student population projection exceeds 1,000 students, at least one of the following mitigation measures must be implemented:	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	

Table 2-1 Mitigation Monitoring Requirements

Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
• **Intersection 1 - Morning View Drive and Pacific Coast Highway:** o Restripe the westbound approach to PCH to have two 12-foot lanes: a left turn lane and a shared left/right-turn lane. Given the curb-to-curb width of approximately 38 feet, the centerline would need to be moved to accommodate the two westbound lanes. Therefore, the eastbound lane would need to be modified with a width of 14 feet. The restriping and left turn pocket would have a minimum length of 200 feet to accommodate the anticipated queue. o Extend the northbound right turn pocket to a total length of 250 feet o Optimize the signal timing • **Intersection 2 – Morning View Drive and Merritt Drive:** o Repaint the pavement markings indicating vehicles to "KEEP CLEAR" and add "KEEP CLEAR" signage on the eastbound and westbound approaches at Morning View Drive per MUTCD standards. The KEEP CLEAR marking should also be shifted east and west prior to the respective approaches to be more visible for drivers so the intersection is not blocked. • **Intersection 4 – Guernsey Avenue and Pacific Coast Highway:** o Option 1: Install a traffic signal at Guernsey & PCH o Option 2: Modify the signal timing at the signalized intersection to the north at Trancas Canyon to increase traffic gaps to reduce the westbound approach traffic delays at Guernsey Avenue. The modifications at PCH & Morning View, PCH & Guernsey, and PCH & Trancas would require approval from				

Table 2-1 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
	Caltrans. If enrollment is projected to increase over 1,000 students based on the annual reporting the District will send to the City, the District would be required to coordinate with the City and Caltrans to implement these improvements. The District would be responsible for providing permits and engineering studies such as a signal warrants study at the intersection of PCH & Guernsey per the MUTCD, under consultation with Caltrans.				
5.16 WILDFIRE					
W-1	The District and its general contractor will prepare a Construction Fire Protection Plan (CFPP) that shall be implemented during all phases of construction activity. The CFPP will be approved by the County of Los Angeles Fire Department (LACoFD) prior to building construction and may also be reviewed and approved in phases based on the phased development of the Proposed Project. The CFPP shall include, but not be limited to, guidance for: • Prevention, control, and extinguishment of fires during construction activities. • Smoking- and fire-related rules, storage, and parking area. • Delineating work areas from natural/open space areas and establishing sufficient setbacks. • Vegetation management prior to and during construction activity, consistent with LACoFD protocols. • Requirement to use spark arrestors on construction equipment. • Limiting the type and duration of construction activities during red flag warning events issued by the National Weather Service covering the project area.	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	
GEO-1	Design recommendations listed in the Geotechnical Report prepared for the Proposed Project shall be followed. These include, but are not limited to, seismic design parameters, foundation design, retaining wall, grading, trenching, etc. Details of these	Construction Contractor, Santa Monica-Malibu Unified School District	Prior to construction of each phase of Project	Santa Monica-Malibu Unified School District City of Malibu	

Table 2-1 Mitigation Monitoring Requirements

Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
recommendations are included in Appendix H.

CONSTRUCTION NOTES

1. ALL CONSTRUCTION & MATERIALS SHALL BE AS SPECIFIED & IN ACCORDANCE WITH ALL APPLICABLE CODES, ORDINANCES, LAWS, PERMITS & THE CONTRACT DOCUMENTS.
2. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE ACCURATE PLACEMENT OF ALL NEW CONSTRUCTION ON THE SITE.
3. THE CONTRACTOR IS RESPONSIBLE FOR ALL EXG SURVEY MONUMENTS WHICH MAY BE DISTURBED THROUGH CONSTRUCTION ACTIVITIES DEEMED NECESSARY FOR PRESERVATION BY THE CIVIL ENGINEER. IF SUCH MONUMENTS WERE DISTURBED, THE APPLICANT SHALL HAVE A LICENSED LAND SURVEYOR QUALIFIED CIVIL ENGINEER REESTABLISH ANY SUCH MONUMENTATION DAMAGED OR DESTROYED DURING THE CONSTRUCTION OF THE PROJECT & SUBMIT "PRELIMINARY CORNER RECORDS" TO THE CIVIL ENGINEER AFTER REPLACEMENT. AFTER APPROVAL BY THE CIVIL ENGINEER, THE APPLICANT SHALL FILE THE CORNER RECORDS WITH THE COUNTY SURVEYOR. PRIOR TO THE EXONERATION OF ANY SECURITY, EVIDENCE OF SUCH FILING SHALL BE FURNISHED TO THE CIVIL ENGINEER.
4. THE CONTRACTOR IS RESPONSIBLE TO INSURE THAT TRUCK ROUTES SHALL BE STEERED AWAY FROM RESIDENTIAL AREAS.
5. THE CONTRACTOR SHALL ENSURE THAT TRUCKS HAULING DIRT ON PUBLIC ROADS TO & FROM THE SITE SHALL BE COVERED OR WILL MAINTAIN A 6" DIFFERENTIAL BETWEEN THE MAX HGT OF ANY HAULED MATERIAL & THE TOP OF THE HAUL TRAILER. HAUL TRUCK DRIVERS SHALL WATER THE LOAD PRIOR TO LEAVING THE SITE TO PREVENT SOIL LOSS DURING TRANSPORT.
6. THE CONTRACTOR SHALL ENSURE THAT GRADED SURFACES USED FOR OFF ROAD PARKING, MATERIALS LAY-DOWN, OR AWAITING FUTURE CONSTRUCTION SHALL BE STABILIZED FOR DUST CONTROL AS NEEDED. FREQUENTLY ACCESSED UNPAVED AREAS SHALL BE PAVED AS EARLY AS POSSIBLE TO MINIMIZE DIRT TRACKOUT TO PUBLIC RIGHTS-OF-WAY.
7. THE CONTRACTOR SHALL COORDINATE ANY LANE CLOSURES OR DETOURS WITH THE CITY/COUNTY. FLAG PERSONS & APPROPRIATE TRAFFIC CONTROL DEVICES SHALL BE USED AS NEEDED TO MINIMIZE CONSTRUCTION ACTIVITY INTERFERENCE WITH OFF-SITE-TRAFFIC.
8. THE CONTRACTOR SHALL VERIFY ALL DIMENSIONS & SITE CONDITIONS BEFORE STARTING WORK. SHOULD A DISCREPANCY APPEAR IN THE CONTRACT DOCUMENTS OR BETWEEN THE CONTRACT DOCUMENTS & EXISTING CONDITIONS, NOTIFY THE ARCHITECT AT ONCE FOR INSTRUCTION ON HOW TO PROCEED.
9. SHOULD A CONFLICT OCCUR BETWEEN DWGS & SPECIFICATIONS, THE MORE COSTLY CONDITION SHALL TAKE PRECEDENCE; UNLESS A WRITTEN DECISION FROM THE ARCHITECT HAS BEEN OBTAINED WHICH DESCRIBES A CLARIFICATION OR ALTERNATE METHOD AND/OR MATERIALS.
10. THE CONTRACTOR SHALL CONFINE HIS OPERATION ON THE SITE TO AREAS PERMITTED BY OWNER.
11. THE JOBSITE SHALL BE MAINTAINED IN A CLEAN, ORDERLY CONDITION FREE OF DEBRIS & LITTER & SHALL NOT BE UNREASONABLY ENCUMBERED WITH ANY MATERIALS OR EQUIPMENT. EACH SUBCONTRACTOR IMMEDIATELY UPON COMPLETION OF EACH PHASE OF HIS WORK SHALL REMOVE ALL TRASH & DEBRIS AS A RESULT OF HIS OPERATION.
12. ALL MATERIAL STORED ON THE SITE SHALL BE PROPERLY STACKED & PROTECTED TO PREVENT DAMAGE & DETERIORATION. FAILURE TO PROTECT MATERIALS MAY BE CAUSE FOR REJECTION OF WORK.
13. THE CONTRACTOR SHALL DO ALL CUTTING, FITTING, AND/OR PATCHING OF HIS WORK THAT MAY BE REQ TO MAKE ELEVERYTHING FIT TOGETHER PROPERLY & SHALL NOT ENDANGER ANY OTHER WORK BY CUTTING, EXCAVATING, OR OTHERWISE ALTERING THE TOTAL WORK OR ANY PART OF IT. ALL PATCHING, REPAIRING AND REPLACING OF MATERIALS AND SURFACES, CUT OR DAMAGED IN EXECUTION OF WORK, SHALL BE DONE WITH APPLICABLE MATERIALS SO THAT SURFACES REPLACED WILL, UPON COMPLETION, MATCH SURROUNDING SIMILAR SURFACES.
14. STRUCTURAL OBSERVATION WILL BE PERFORMED BY THE STRUCTURAL ENGINEER, WHEN REQ, A STATEMENT IN WRITING SHALL BE GIVEN TO THE BUILDING OFFICIAL, STATING THAT THE SITE VISITS HAVE BEEN MADE & WHETHER OR NOT ANY OBSERVED DEFICIENCIES HAVE BEEN CORRECTED TO CONFORM TO THE APPROVED PLANS & SPECIFICATIONS.
15. SUBMITTAL DOCUMENTS FOR DEFERRED SUBMITAL ITEMS SHALL BE SUBMITTED TO THE ARCHITECT OR ENGINEER OF RECORD, WHO SHALL REVIEW THEM & RETURN THEM TO THE CONTRACTOR (WITH A NOTIFICATION INDICATING THAT THE DEFERRED SUBMITTAL DOCUMENTS HAVE BEEN REVIEWED & THAT THEY HAVE BEEN FOUND TO BE IN GENERAL CONFORMANCE WITH THE DESIGN OF THE BUILDING) FOR PLAN CHECK APPROVAL. THE DEFERRED SUBMITTAL ITEMS SHALL NOT BE INSTALLED UNTIL THEIR DESIGN & SUBMITTAL DOCUMENTS HAVE BEEN APPROVED BY THE AUTHORITY HAVING JURISDICTION.
16. PROVIDE ALL ACCESS PANELS AS REQ BY GOVERNING CODES TO ALL CONCEALED SPACES, VOIDS, ATTICS, ETC. VERIFY TYPE REQ WITH ARCHITECT PRIOR TO INSTALLATION.
17. NO PORTION OF WORK REQ A SHOP DWG OR SAMPLE SUBMISSION SHALL BE COMMENCED UNTIL THE SUBMISSION HAS BEEN REVIEWED BY THE ARCHITECT. ALL SUCH PORTIONS OF THE WORK SHALL BE IN ACCORDANCE WITH CORRECTED SHOP DWGS. AND SAMPLES.
18. DIMENSIONS:
    A. ALL DIMS SHALL TAKE PRECEDENCE OVER SCALE.
    B. ALL DIMS ARE TO FACE OF STUD / CONCRETE / MASONRY UNO
    C. CLG HGT DIMS ARE FROM FACE OF SLAB TO FACE OF FIN CLG MATERIAL UNO
19. DO NOT SCALE DRAWINGS
20. PROVIDE ALL NECESSARY BLOCKING, BACKING, & FRAMING FOR LIGHT FIXTURES, ELECTRIC UNITS, AC EQUIP, RECESSED ITEMS, AND ALL OTHER ITEMS AS REQ.
21. WHERE LARGER STUDS OR FURRING ARE REQ TO COVER PIPING AND CONDUITS, THE LARGER STUD SIZE OR FURRING SHALL EXTEND THE FULL SURFACE OF THE WALL WIDTH AND LENGTH WHERE THE FURRING OCCURS, UNO.
22. ALL DOORS SHALL BE OPERABLE FROM THE INSIDE W/O THE USE OF A KEY OR SPECIAL KNOWLEDGE OF EFFORT. EXIT SIGNS SHALL BE PROVIDED AT ALL EXITS AS REQ BY THE APPLICABLE CODES. ALL DOOR SWINGS SERVING AN OCCUPANT LOAD OF 50 OR GREATER SHALL SWING IN THE DIRECTION OF TRAVEL.
23. ALL GLASS AND GLAZING SHALL COMPLY WITH THE APPLICABLE CODES.
24. WALL AND CLG MATERIALS SHALL NOT EXCEED THE FLAME SPREAD CLASSIFICATIONS IN THE APPLICABLE CODES.
25. SURVEYORS CERTIFICATE REQ PRIOR TO FINAL COMPLETION.
26. THE CONTRACTOR SHALL COMPLY WITH THE APPLICABLE CODES FOR FIRE SAFETY DURING CONSTRUCTION AND DEMOLITION.
27. A DSA CERTIFIED CLASS 1 PROJECT INSPECTOR EMPLOYED BY THE DISTRICT (OWNER) AND APPROVED BY THE DIVISION OF THE STATE ARCHITECT (DSA) SHALL PROVIDE CONTINUOUS INSPECTION OF THE WORK. THE DUTIES OF THE INSPECTOR ARE DEFINED IN SECTION 4-342, CALIFORNIA BUILDING STANDARDS ADMINISTRAIVE CODE (PART 1, TITLE 24, CCR)
28. A DSA ACCEPTED TESTING LABORATORY DIRECTLY EMPLOYED BY THE DISTRICT (OWNER) SHALL CONDUCT ALL THE REQ TESTS AND INSPECTIONS FOR THE PROJECT.
29. CHANGE TO THE APPROVED DRAWINGS AND SPECIFICATIONS SHALL BE MADE BY ADDENDA OR CONSTRUCTION CHANGE DOCUMENT (CCD) APPROVED BY DSA, AS REQ BY SECTION 4-338, PART 1, TITLE 24, CCR.
30. THE INTENT OF THESE DWGS AND SPECIFICATIONS IS THAT THE WORK OF THE ALTERATION, REHABILITATION OR RECONSTRUCTION IS TO BE IN ACCORDANCE WITH TITLE 24, CCR. SHOULD ANY EXG CONDITIONS SUCH AS DETERIORATION OR NON-COMPLYING CONSTRUCTION BE DISCOVERED WHICH IS NOT COVERED BY THE CONTRACT DOCUMENTS WHEREIN THE FINISHED WORK WILL NOT COMPLY WITH TITLE 24, CCR, A CONSTRUCTION CHANGE DOCUMENT (CCD), OR A SEPARATE SET OF PLANS AND SPECIFICATIONS, DETAILING AND SPECIFYING THE REQ WORK SHALL BE SUBMITTED TO AND APPROVED BY DSA BEFORE PROCEEDING WITH THE WORK. (SECTION 4-317(c), PART 1, TITLE 24, CCR)
31. CONTRACTOR SHALL BE RESPONSIBLE FOR ALL PHASED CONSTRUCTION. THIS INCLUDES ALL PARTIAL DEMO, INSTALL AND COORDINATION OF SYSTEMS THAT MAY HAVE TO BE PARTIALLY BUILT WHILE RUNNING IN CONJUNCTION WITH EXISTING SYSTEMS. LIQUIDATED DAMAGES WILL APPLY FOR ANY DELAYS CAUSED BY THE CONTRACTOR. NO DEMOLITION SHALL BEGIN UNTIL THE PLANS HAVE BEEN APPROVED BY DSA.

DEFERRED APPROVALS

DEFERRED APPROVALS:

NOTE: THE CONTRACTOR TO PROVIDE ALL DEFERRED APPROVALS WITHIN 2 MONTHS OF THE NOTICE TO PROCEED IN ORDER NOT TO DELAY THE CONSTRUCTION SCHEDULE, INSTALLATION OF THE FOLLOWING LISTED ITEMS SHALL NOT BE STARTED UNTIL DETAILED PLANS AND SPECIFICATIONS ARE APPROVED BY THE DIVISION OF THE STATE ARCHITECT (DSA). THE PLANS AND SPECIFICATIONS SHALL BE STAMPED AND SIGNED BY THE ARCHITECT AND ENGINEER OF RECORD PRIOR TO SUBMITTING TO DSA

1. ALUMINUM CURTAINWALL AND STOREFRONT SYSTEMS.
2. HORIZONTAL SOLAR SHADING DEVICES.
3. ELEVATOR GUIDE RAILS, SUPPORT BRACKETS AND ANCHORAGE.
4. MEP DISTIBUTION SYSTEM SUPPORT AND BRACING.

THE ITEMS LISTED ABOVE SHALL BE SIGNED AND CALCULATED BY THE CONTRACTOR AND BE SUBMITTED TO DSA FOR APPROVAL. ALL ITEMS LISTED SHALL NOT BE FABRICATED OR PLACED ON THE JOBSITE PRIOR TO DSA APPROVAL AND ARCHITECTS REVIEW

FIRE AND LIFE SAFETY NOTES

1. PLANS FOR THE FIRE SPRINKLER SYSTEMS MUST BE APPROVED BY THE AUTHORITY HAVING JURISDICTION (AHJ) PRIOR TO INSTALLATION. SUBMIT PLANS IN A MANNER WHICH WILL NOT IMPEDE THE PROGRESS OF CONSTRUCTION.
2. FIRE SPRINKLER SYSTEMS & INSTALLATION SHALL CONFORM W/ THE APPLICABLE STANDARDS AND CODES.
3. FIRE SPRINKLER SYSTEMS TO BE TIED INTO THE ALARM SYSTEM PER THE APPLICABLE CODES.
4. AUTOMATIC SPRINKLER SYSTEM(S) SHALL BE SUPERVISED BY AN APPROVED CENTRAL OR REMOTE STATION SERVICE, AND/OR SHALL BE PROVIDED W/ A LOCAL ALARM WHICH WILL GIVE AN AUDIBLE SIGNAL.
5. FIRE SPRINKLER SYSTEM(S) & ALL CONTROL VALVES SHALL BE SUPERVISED BY A U.L. LISTED CENTRAL ALARM STATION OR PER THE APPLICABLE CODES.
6. FIRE HYDRANT & FIRE SPRINKLER SYSTEM(S) SHALL BE FLUSHED THOROUGHLY BEFORE CONNECTION IS MADE TO EXISTING SYSTEM STUBOUTS & WITNESSED BY THE PROJECT INSPECTOR.
7. A HYDROSTATIC TEST (200 PSI PRESSURE FOR 2 HRS. OR @ 50 PSI IN EXCESS OF THE MIN. STATIC PRESSURE WHEN IT IS IN EXCESS OF 150 PSI) SHALL BE WITNESSED BY THE PROJECT INSPECTOR PRIOR TO COVERING PIPING JOINTS.
8. A 3' CLR SPACE SHALL BE MAINTAINED AROUND THE CIRCUMFERENCE OF FIRE HYDRANTS EXCEPT AS OTHERWISE REQ OR APPROVED PER THE APPLICABLE CODES.
9. THRUST BLOCKS SHALL BE PROVIDED WHEREVER PIPE CHANGES DIRECTION.
10. ALL PIPE SHALL BE UL LISTED FOR FIRE SERVICE SYSTEMS, CLASS 200 MIN.
11. FIRE DEPARTMENT CONNECTIONS SHALL BE LOCATED W/I 100' FROM A PUBLIC FIRE HYDRANT PER THE APPLICABLE STANDARDS AND CODES.
12. FIRE SPRINKLER RISER SHALL BE LOCATED WITHIN 5 FT OF THE EXT WALL (OR AS REQ BY THE AHJ) AND TERMINATE 6" ABV FF
13. AN ALL-WEATHER FIRE ACCESS ROAD SHALL BE IN PLACE BEFORE ANY COMBUSTIBLE MATERIALS ARE PLACED ON THE SITE OR AS REQ BY THE AHJ.
14. STORAGE, DISPENSING, OR USE OF ANY FLAMMABLE & COMBUSTIBLE LIQUIDS, FLAMMABLE & COMPRESSED GASES & OTHER HAZARDOUS MATERIALS SHALL COMPLY W/ THE APPLICABLE CODES.
15. EXIT SIGNS SHALL BE POSTED OVER EXIT DOORS & DIRECTIONAL EXIT SIGNS SHALL BE LOCATED TO DIRECT PERSONS TOWARD EXIT DOORS.
16. EXIT SIGNS SHALL BE SELF-LUMINOUS TYPE OR ELECTRONICALLY ILLUMINATED & ENERGIZED FROM SEPARATE CIRCUITS, ONE OF WHICH SHALL BE FROM STORAGE BATTERIES OR AN ON-SITE GENERATOR, FOR A DURATION OF 90 MINUTES PER THE APPLICABLE CODES.
17. EXIT DOORS SHALL BE OPENABLE FROM THE INSIDE WITHOUT THE USE OF A KEY OR ANY SPECIAL KNOWLEDGE OR EFFORT.
18. ACCESS GATE(S) SHALL BE OPENABLE W/ FIRE DEPT MASTER KEY FROM THE EXTERIOR.
19. CURBS ALONG FIRE LANES SHALL BE PAINTED SAFETY RED & MARKED "FIRE LANE NO PARKING" W/ 3" WHITE LETTERS ON THE TOP OF CURBING EVERY 30' AS INDICATED ON THE APPROVED DRAWINGS.
20. APPROVED NUMBERS OR ADDRESSES SHALL BE PROVIDED FOR ALL NEW & EXG BLDGS IN SUCH A POSITION AS TO BE PLAINLY VISIBLE & LEGIBLE FROM THE STREET OR ROAD FRONTING THE PROPERTY PER THE APPLICABLE CODES.
21. PROVIDE PERMANENT OR TEMPORARY STANDPIPES WHILE BUILDING IS UNDER CONSTRUCTION PER THE APPLICABLE CODES.
22. PROVIDE FIRE EXTINGUISHERS PER THE REQ THE APPLICABLE STANDARDS AND CODES.

ENERGY CODE NOTES

THE CALIFORNIA ENERGY CODE SECTION 10-103 REQUIRES ACCEPTANCE TESTING ON ALL NEWLY INSTALLED LIGHTING CONTROLS, MECHANICAL SYSTEMS, ENVELOPES, AND PROCESS EQUIPMENT AFTER INSTALLATION AND BEFORE PROJECT COMPLETION. AN ACCEPTANCE TEST IS A FUNCTIONAL PERFORMANCE TEST TO HELP ENSURE THAT NEWLY INSTALLED EQUIPMENT IS OPERATING AND IN COMPLIANCE WITH THE ENERGY CODE.

LIGHTING CONTROLS ACCEPTANCE TESTS MUST BE PERFORMED BY A CERTIFIED LIGHTING CONTROLS ACCEPTANCE TEST TECHNICIAN (ATT).

MECHANICAL SYSTEM ACCEPTANCE TESTS MUST BE PERFORMED BY A CERTIFIED MECHANICAL ATT FOR PROJECTS SUBMITTED ON OR AFTER OCTOBER 1, 2021.

ENVELOPE AND PROCESS EQUIPMENT ACCEPTANCE TESTS SHALL BE PERFORMED BY THE INSTALLING CONTRACTOR, ENGINEER/ARCHITECT OF RECORD OR THE OWNER'S AGENT.

A LISTING OF CERTIFIED ATT CAN BE FOUND AT: HTTPS://WWW.ENERGY.CA.GOV/PROGRAMS-AND-TOPICS/PROGRAMS/ACCEPTANCE-TEST-TECHNICIAN-CERTIFICATION-PROVIDER-PROGRAM/ACCEPTANCE.

THE ACCEPTANCE TESTING PROCEDURES MUST BE REPEATED, AND DEFICIENCIES MUST BE CORRECTED BY THE BUILDER OR INSTALLING CONTRACTOR UNTIL THE CONSTRUCTION/INSTALLATION OF THE SPECIFIED SYSTEMS CONFORM AND PASS THE REQUIRED ACCEPTANCE CRITERIA.

PROJECT INSPECTORS WILL COLLECT THE FORMS TO CONFIRM THAT THE REQUIRED ACCEPTANCE TESTS HAVE BEEN COMPLETED.

RESPONSIBILITY FOR JOB SITE SAFETY

NOTICE TO PERSONS PERFORMING WORK ON JOB SITE, INCLUDING CONTRACTORS, SUBCONTRACTORS, MATERIAL SUPPLIERS AND ANY AGENTS OR EMPLOYEES THEREOF

THESE PLANS AND SPECIFICATIONS DO NOT PROVIDE ANY DIRECTION OR INSTRUCTIONS TO CONTRACTORS, SUBCONTRACTORS, MATERIAL SUPPLIERS OR THEIR EMPLOYEES OR AGENTS RELATED TO CONSTRUCTION MEANS, METHODS, TECHNIQUES, SEQUENCES OR PROCEDURES, SAFETY PRECAUTIONS, MANNERS OR METHODS OF EGRESS OR INGRESS, INCLUDING BUT NOT LIMITED TO JOB SITE SAFETY, THE PHYSICAL CONDITION OF THE JOB SITE, THE MANNER OR METHOD IN WHICH THE AREA WHERE WORK IS PERFORMED IS ACCESSED BY WORKERS, AND SAFETY PROGRAMS OR SAFETY PROTOCOLS OF ANY KIND IN CONNECTION WITH THE WORK. ALL OF THE FOREGOING ARE SOLELY AND EXCLUSIVELY THE RESPONSIBILITY OF THE CONTRACTOR, SUBCONTRACTOR, MATERIAL SUPPLIERS, OR ANY AGENTS OR EMPLOYEES THEREOF.

THE ARCHITECT EXPRESSLY DISCLAIMS ANY CONTROL OVER AND RESPONSIBILITY FOR CONSTRUCTION MEANS, METHODS, TECHNIQUES, SEQUENCES OR PROCEDURES, SAFETY PRECAUTIONS, MANNERS OR METHODS OF EGRESS OR INGRESS, INCLUDING BUT NOT LIMITED TO JOB SITE SAFETY, THE PHYSICAL CONDITION OF THE JOB SITE, THE MANNER OR METHOD IN WHICH THE AREA WHERE WORK IS PERFORMED IS ACCESSED BY WORKERS, AND SAFETY PROGRAMS OR SAFETY PROTOCOLS OF ANY KIND IN CONNECTION WITH THE WORK.

THE ARCHITECT HAS NOT CONDUCTED AN EVALUATION OR ANALYSIS OF SAFETY PROCEDURES OR APPLICABLE LAW REGARDING OR RELATING TO ACCESSING THE JOB SITE OR AREAS OF THE WORK DURING THE COURSE OF CONSTRUCTION.

THE ARCHITECT, THE ARCHITECT'S DESIGNS, AND ANY OTHER WORK PERFORMED BY THE ARCHITECT DO NOT ADDRESS, ANALYZE OR PROVIDE ANY DIRECTION OR ADVICE TO ANY PERSON OR ENTITY ON WHETHER OR NOT THE USE OF EXISTING LADDERS, DOORS, RAILINGS, INGRESS AND INGRESS ROUTES OR THE LIKE ARE IN COMPLIANCE OR NON-COMPLIANCE WITH OSHA, CAL-OSHA(CALIFORNIA ONLY), OR ANY OTHER APPLICABLE STATUTE, REGULATION, OR STANDARD RELATED TO JOB SITE SAFETY DURING THE COURSE OF CONSTRUCTION OF THE IMPROVEMENTS.

PROJECT NORTH

PROJECT SCOPE

THIS PROJECT INCLUDES THE CONSTRUCTION OF A NEW SPECIAL EDUCATION AND CAMPUS WELLNESS CENTER BUILDING, NEW GYMNASIUM BUILDING - INCLUDING FITNESS, NEW FIRELANE FOR NEW BUILDING ACCESS, NEW WASTEWATER SYSTEM, ASSOCIATED GRADING AND UNDERGROUND UTILITY WORK, AND ASSOCIATED SITE IMPROVEMENTS.

LIMIT OF WORK

THE INTENT OF THE LIMIT OF WORK LINE IS TO DESCRIBE IN GENERAL THE AREAS AFFECTED BY PROJECT CONSTRUCTION. IT IS NOT INTENDED TO BE AN EXACT INDICATION OR EDGE OF THE CONSTRUCTION AREA. THE CONTRACTOR SHOULD VISIT THE SITE AND BECOME FAMILIAR WITH EXISTING CONDITIONS AND THEIR RELATIONSHIP TO THE WORK PROPOSED IN THE CONTRACT DOCUMENTS. ALL ITEMS NECESSARY FOR THE PROPER EXECUTION AND COMPLETION OF THE WORK SHALL BE INCLUDED. THE CONTRACT DOCUMENTS ARE COMPLEMENTARY AND WHAT IS REQUIRED BY ONE SHALL BE BINDING AS IF REQUIRED BY ALL TO THE EXTENT THAT IT IS REASONABLY INFERABLE FROM THEM AS BEING NECESSARY TO PRODUCE THE INTENDED RESULTS.

2022 CALIFORNIA REFERENCED STANDARDS CODE, PART 12, TITLE 24 CCR
TITLE 19 CCR, PUBLIC SAFETY, STATE FIRE MARSHAL REGULATIONS

APPLICABLE STANDARDS

FOR A LIST OF APPLICABLE STANDARDS, INCLUDING CALIFORNIA AMENDMENTS TO THE NFPA STANDARDS, REFER TO CBC CHAPTER 35 AND CFC CHAPTER 80.

ACCESSIBLE CONSTRUCTION SUPPORT FACILITIES

11B-201.4 CONSTRUCTION SUPPORT FACILITIES. These requirements shall apply to temporary or permanent construction support facilities for uses and activities not directly associated with the actual processes of construction, including but not limited to offices, meeting rooms, plan rooms, other administrative or support functions. When provided, toilet and bathing facilities serving construction support facilities shall comply with 11B-213. When toilet and bathing facilities serving construction support facilities are provided by portable units, at least one of each type shall be accessible and connected to the construction support facilities it serves by an accessible route.

EXCEPTION: During construction an accessible route shall not be required between site arrival points or the boundary of the area of construction and the entrance to the construction support facilities if the only means of access between them is a vehicular way not providing pedestrian access.

STATEMENT OF GENERAL CONFORMANCE

Application No.: 03-125562

File No.: 19-H24

The drawings identified as follows:

☒ All drawing sheets included in this set not bearing my stamp and signature.
☐ Drawing sheets denoted in the sheet index as follows: _____
☐ Drawing sheets included under the following PC approval(s): _____

have been prepared by other design professionals or consultants who are licensed and authorized to prepare such drawings (plans) in this state. They have been examined by me for:

1) Design intent and appear to meet the appropriate requirements of Title 24, California Code of Regulations and the project specifications prepared by me, and
2) Coordination with my drawings (plans) and specifications and are acceptable for incorporation into the construction of this project.

Per Title 24, Part 1, Section 4-316(b): This Statement of General Conformance shall not be construed as relieving me of my rights, duties, and responsibilities under Sections 17302 and 81138 of the Education Code and Sections 4-336, 4-341 and 4-344 of Title 24, Part 1.

FIRE & LIFE SAFETY SITE CONDITIONS SUBMITTAL

Division of the State Architect (DSA) documents referenced within this publication are available on the DSA Forms or DSA Publications webpages.

To facilitate the Division of the State Architect's (DSA) fire and life safety plan review of project site conditions, DSA requires the design professional to provide the following information at time of project submittal for projects consisting of construction of a new campus, construction of new building(s), additions to existing buildings, and for site alternate design means for fire department emergency vehicle access, and fire suppression water supply.

Information associated with compliance items 1 through 3 below is to be provided for all project types indicated above. Information associated with items 4 through 7 is to be completed when an alternate means is utilized. Acknowledgement by the school district and signature from the Local Fire Authority (LFA) is only required when an alternate design means is being requested.

The Project Information and Fire & Life Safety Information sections are to be completed for all projects and imaged onto the fire access site plan. When an alternate design/means is proposed, all sections on pages 1 and 2 are to be completed and imaged on the fire access site plan.

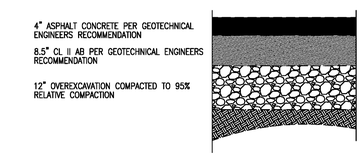
For additional information refer to the instructions at the end of this form and DSA Policy *PL 09-01: Fire Flow for Buildings.*

PROJECT INFORMATION	
School District/Owner:	SANTA MONICA-MALIBU UNIFIED SCHOOL DISTRICT
Project Name/School:	Malibu MS/HS PH2: Hub and Gym
Project Address:	30215 Morning View Dr, Malibu, CA 90265

FIRE & LIFE SAFETY INFORMATION				
1.	Has a fire hydrant flow test been performed within the past 12 months? *(If yes, provide a copy of the test data.)*	Yes ☑		No ☐
2.	Was the fire hydrant water flow test performed as part of this LFA review?	Yes ☑		No ☐
3.	Is the project located within a designated fire hazard severity zone (FHSZ) as established by Cal-Fire? *(If yes, indicate FHSZ classification below.)*	Yes ☑		No ☐
	Refer to the following website for FHSZ locations: Fire Hazard Severity Zones in State Responsibility Area	Moderate ☐	High ☐	Very High ☑
	Wildland Interface Area (WIFA) *(If any designations are checked, project design must meet the requirements of CBC Chapter 7A.)*			WIFA ☑

CONDITION MEANS AND METHODS RESOLUTION		ALTERNATE ACCEPTED			
		Yes	No	N/A	N/R
4.	Emergency vehicle access roadways do not meet CFC requirements.				
4a.	**Acceptable Alternate:** Emergency vehicle and personnel access as proposed by the project architect is acceptable for providing fire suppression and protection of life and property.				
5.	**Fire Hydrants:** Number and spacing does not meet CFC requirements.				
5a.	**Acceptable Alternate:** Number of fire hydrants and spacing as proposed by the project architect is acceptable for fire suppression and protection of life and property.				
6.	**Fire Hydrants:** Water flow and pressure are less than CFC minimum.				
6a.	**Acceptable Alternate:** The available flow and pressure is acceptable for providing fire suppression and protection of life and property.				
7.	Location of fire department connection(s) serving fire sprinkler systems or standpipe systems does not meet CFC requirements.				
7a.	**Acceptable Alternate:** The location of fire department connection serving the fire sprinkler system and/or standpipe system is acceptable for providing fire suppression and protection of life and property.				

School District Acceptance of Acceptable Design Alternates



By signing this form, the school district acknowledges and accepts the proposed design as an alternative to California Building Code (CBC) and California Fire Code (CFC) minimum requirements, as indicated by one or more of the conditions indicated at items 4a, 5a, 6a or 7a, for providing fire and life safety protection of life and property.

FIRE FLOW & HYDRANT REQUIREMENTS

2022 CALIFORNIA FIRE CODE, APPENDIX BB105.1 (FIRE FLOW REQUIREMENTS FOR BUILDINGS) & APPENDIX CC, TABLE CC105.1 (NUMBER AND DISTRIBUTION OF FIRE HYDRANTS)

MS HUB (BUILDING D):
(TYPE II-B, 1 STORY, 16,615 SF, FULLY SPRINKLERED)
FIRE FLOW PER TABLE BB105.1: 2,000 GPM FOR 2 HR DURATION

REDUCTION IN REQUIRED FIRE-FLOW UP TO 75%, WITH A MINIMUM FIRE-FLOW RATE OF 1,500 GPM, FOR THE PRESCRIBED DURATION IN TABLE BB105.1 PER 2022 CFC SECTION BB105.1 & DSA POLICY PL 09-01

REDUCED BY 75% FOR APPROVED AUTOMATIC FIRE SPRINKLER SYSTEM.
REQUIRED FIRE FLOW: 2,750 X 25% = 688 GPM < 1,500 GPM CODE REQUIRED MINIMUM

MIN REQUIRED FLOW = 1,500 GPM
1,500 GPM FOR 2 HR DURATION @ 20 PSI

REQUIRED HYDRANTS (CC105.1):
1 HYDRANTS REQUIRED AT 500 FT SPACING, 250 FT MAX. DISTANCE FROM ANY POINT ON THE STREET OR ROAD FRONTAGE TO A HYDRANT.

GYM (BUILDING D1):
(TYPE II-B, 2 STORY, 37,516 SF, FULLY SPRINKLERED)
FIRE FLOW PER TABLE BB105.1: 2,000 GPM FOR 2 HR DURATION

REDUCTION IN REQUIRED FIRE-FLOW UP TO 75%, WITH A MINIMUM FIRE-FLOW RATE OF 1,500 GPM, FOR THE PRESCRIBED DURATION IN TABLE BB105.1 PER 2022 CFC SECTION BB105.1 & DSA POLICY PL 09-01

REDUCED BY 75% FOR APPROVED AUTOMATIC FIRE SPRINKLER SYSTEM.
REQUIRED FIRE FLOW: 4,000 X 25% = 1,000 GPM < 1,500 GPM CODE REQUIRED MINIMUM

MIN REQUIRED FLOW = 1,500 GPM
1,500 GPM FOR 2 HR DURATION @ 20 PSI

REQUIRED HYDRANTS (CC105.1):
1 HYDRANTS REQUIRED AT 500 FT SPACING, 250 FT MAX. DISTANCE FROM ANY POINT ON THE STREET OR ROAD FRONTAGE TO A HYDRANT

FIRE FLOW TEST RESULTS - ON-SITE HYDRANTS

(E) HYDRANT #1:
STATIC PRESSURE: 70 PSI
RESIDUAL PRESSURE: 47 PSI
OBSERVED FLOW: 1,110 GPM
FLOW CALCULATED AT 20 PSI (RES): 1,688 GPM

(E) HYDRANT #2:
STATIC PRESSURE: 73 PSI
RESIDUAL PRESSURE: 49 PSI
OBSERVED FLOW: 1,060 GPM
FLOW CALCULATED AT 20 PSI (RES): 1,626 GPM

(E) HYDRANT #3:
STATIC PRESSURE: 90 PSI
RESIDUAL PRESSURE: 75 PSI
OBSERVED FLOW: 1,320 GPM
FLOW CALCULATED AT 20 PSI (RES): 3,033 GPM

FIRE ACCESS NOTES

1. PROVIDE APPROVED SIGNS OR OTHER APPROVED NOTICES OR MARKINGS THAT INCLUDE THE WORDS "NO PARKING - FIRE LANE." SIGNS SHALL HAVE A MINIMUM DIMENSION OF 12 INCHES WIDE BY 18 INCHES HIGH AND HAVE RED LETTERS ON A WHITE REFLECTIVE BACKGROUND. SIGNS SHALL BE PROVIDED FOR FIRE APPARATUS ACCESS ROADS, TO CLEARLY INDICATE THE ENTRANCE TO SUCH ROAD, OR PROHIBIT THE OBSTRUCTION THEREOF AND AT INTERVALS, AS REQUIRED BY THE FIRE INSPECTOR. FIRE CODE 503.3.
2. WHEN SECURITY GATES ARE PROVIDED, MAINTAIN A MINIMUM ACCESS WIDTH OF 20 FEET. THE SECURITY GATE SHALL BE PROVIDED WITH AN APPROVED MEANS OF EMERGENCY OPERATION AND SHALL BE MAINTAINED OPERATIONAL AT ALL TIMES AND REPLACED OR REPAIRED WHEN DEFECTIVE. ELECTRIC GATE OPERATORS, WHERE PROVIDED, SHALL BE LISTED IN ACCORDANCE WITH UL 325. GATES INTENDED FOR AUTOMATIC OPERATION SHALL BE DESIGNED, CONSTRUCTED, AND INSTALLED TO COMPLY WITH THE REQUIREMENTS OF ASTM F2200. GATES SHALL BE OF THE SWINGING OR SLIDING TYPE. CONSTRUCTION OF GATES SHALL BE OF MATERIALS THAT ALLOW MANUAL OPERATION BT ONE PERSON. FIRE CODE 503.6.
3. APPROVED BUILDING ADDRESS NUMBERS, BUILDING NUMBERS, OR APPROVED BUILDING IDENTIFICATION SHALL BE PROVIDED AND MAINTAINED SO AS TO BE PLAINLY VISIBLE AND LEGIBLE FROM THE STREET FRONTING THE PROPERTY. THE NUMBERS SHALL CONTRAST WITH THEIR BACKGROUND, BE ARABIC NUMERALS OR ALPHABET LETTERS, AND BE A MINIMUM OF FOUR INCHES HIGH WITH A MINIMUM STROKE WIDTH OF 0.5 INCH. FIRE CODE 505.1.
4. FIRE APPARATUS ACCESS ROADS SHALL BE IDENTIFIED WITH APPROVED SIGNS. TEMPORARY SIGNS SHALL BE INSTALLED AT EACH STREET INTERSECTION WHEN CONSTRUCTION OF NEW ROADWAYS ALLOWS PASSAGE BY VEHICLES. SIGNS SHALL BE OF AN APPROVED SIZE, WEATHER RESISTANT AND BE MAINTAINED UNTIL REPLACED BY PERMANENT SIGNS. FIRE CODE 505.2.
5. AN APPROVED KEY BOX, LISTED IN ACCORDANCE WITH UL 1037 SHALL BE PROVIDED AS REQUIRED BY FIRE CODE 506. THE LOCATION OF EACH KEY BOX SHALL BE DETERMINED BY THE FIRE INSPECTOR.
6. WHEN ANY PORTION OF A PROPOSED STRUCTURE EXCEEDS THE ALLOWABLE DISTANCE FROM A PUBLIC FIRE HYDRANT, VIA FIRE APPARATUS ACCESS, ON-SITE HYDRANTS SHALL BE PROVIDED. THE SPACING DISTANCE BETWEEN ON-SITE HYDRANTS SHALL BE 300 TO 400 FEET. ALL ON-SITE FIRE HYDRANTS SHALL HAVE A MINIMUM FIRE-FLOW OF 1,250 GALLONS PER MINUTE AT 20 PSI FOR A DURATION OF 2 HOURS. IF MORE THAN ONE ON-SITE FIRE HYDRANT IS REQUIRED, THE FIRE FLOW SHALL BE LESSER OF EITHER THE REQUIRED FIRE FLOW OF THE BUILDING, OR 2,500 GALLONS PER MINUTE AT 20 PSI FOR A DURATION OF 2 HOURS. ALL ON-SITE HYDRANTS SHALL BE INSTALLED A MINIMUM OF 25 FEET FROM A STRUCTURE OF PROTECTED BY A 2-HOUR FIRE WALL, IN ACCORDANCE WITH APPENDIX TABLE B105.1. FIRE CODE C106.1
7. ALL FIRE HYDRANTS SHALL MEASURE 6" X 4" X 2-2/2", BRASS OR BRONZE, CONFORMING TO AMERICAN WATER WORKS ASSOCIATION STANDARD C503, OR APPROVED EQUAL.
8. REFERENCE SHEET 2-2-A2-6.11 FOR ADDITIONAL INFORMATION REGARDING SITE PEDESTRIAN GATES.

GENERAL NOTES

1. ROOFING SYSTEM TO BE CLASS A RATED.

2. ROOF SYSTEM SHALL BE SLOPED A MINIMUM OF 1/4 INCH IN 12 INCHES AT VALLEYS FOR DRAINAGE. VERIFY PRIOR TO CONSTRUCTION. NOTIFY ARCHITECT IMEDIATELY IN CASE OD DISCREPANCIES.

3. PRIOR TO THE ISSUANCE OF USE AND OCCUAPNCY, WRITTEN CERTIFICATION BY A CALIFORNIA REGISTERED ENGINEER THAT THE ROOF IS IN CONFORMANCE WITH THE APPROVED PLANS SHALL BE SUBMITTED TO THE PROJECT INSPECTOR.

4. INSTALLATION OF THE ROOFING SHALL BE IN STRICT ACCORDANCE WITH MANUFACTURERS' SPECIFICATIONS AND PROCEDURES.

5. ALL PENETRATIONS THROUGH THE ROOF SHALL BE BY THE USE OF ROUND CONDUIT FOR PIPES, VENTS, RISERS AND EQUIPMENT SUPPORTS. THE USE OF CHANNELS, ANGLES, OR UNI-STRUT THROUGH THE ROOF WITH PITCH POCKETS SHALL NOT BE ALLOWED.

6. ALL LIGHT FIXTURE DIMENSIONS ARE TO CENTER LINE OF FIXTURE OR GROUP OF FIXTURES, U.N.O.

7. SEE ELECTRICAL, MECHANICAL, LOW VOLTAGE AND FIRE ALARM DRAWINGS FOR EQUIPMENT SPECIFICATIONS AND LEGENDS.

8. FOR PENETRATIONS IN RATED EXTERIOR CMU WALLS, PROVIDE FIRESTOPPING ON BOTH SIDES OF WALL. ON THE EXTERIOR SIDE, RECESS THE FIRESTOPPING WITHIN THE CMU AND COVER WITH AN APPROVED UV RESISTANT & WATERPROOF SEALANT - COLOR TO MATCH FINISH OF CMU.

MDF - EXTERIOR ELEVATIONS & BUILDING SECTIONS

1-A3.01

CAST-IN-PLACE CONCRETE

1. Concrete mixing shall comply with ASTM C94.

2. Hydraulic Cement:
   A. ASTM C595 see table for types.
   B. Alternatively, ASTM C150 type II/V.

3. Aggregates:
   A. Normal Weight Concrete Aggregate (NW): ASTM C33 for aggregates of natural sand and rock. The maximum aggregate size is noted in the table below. The maximum dry density shall be 145 pcf.
      a. Where smaller aggregate is required for workability or areas of congestion, the contractor shall submit a request to the structural engineer prior to submitting the mix design. Pea gravel is not permitted.
   B. Light Weight Aggregate (LW) for Structural Concrete: ASTM C330, expanded shale lightweight aggregate. The maximum dry density shall be 115 pcf.
   C. Alkali Aggregates: Aggregate shall be non-reactive per ASTM C1778.

4. See the table below for the required concrete properties:

Class	Use/Location	Strength (psi) 28-Day	Agg Type	Max Agg Size (in)	Slump (in)	Max w/c	Target Air %	ASTM C595 Type	Exposure Category	GWP Limit kgCO$_2$e/m^3
A	UNLESS NOTED OTHERWISE	4,000	NW	1	3-5	0.5	--	IL	F0,S0	324
B	FOOTING AND GRADE BEAMS	4,000	NW	1	3-5	0.5	--	IL (HS)	F0,S0,C1*	324
C	SLAB ON GRADE	4,500	NW	1	3-5	0.45	--	IL	F0,S0	378
D	WALLS	4,000	NW	1	3-5	0.45	--	IL	F0,S0,C1*	324
E	COLUMNS	5,000	NW	1	3-5	0.5	--	IL	F0,S0	378
F	FILL ON DECK	4,000	LW	3/4	3-5	0.45	--	IL	F0,S0	594
G	PIERS / CAISSONS	3,000	NW	1 1/2	5-7	0.6	--	IL	F0,S0,C1*	280

* An exposure class of C1 is assumed for concrete in contact with soil exposed to moisture per ACI 318, but not due to external sources of chlorides.

5. Slump: Per ACI 301, CH. 4 and CBC section 1705.3. The specified slump above is measured before applying chemical add mixtures. The slump may be increased up to a maximum 8" at the contractor's option for workability and should be noted in the mix design submittal.

6. Global Warming Potential (GWP): as defined in the specifications.
   A. Concrete may be considered one product category to comply with the GWP Limit. A weighted average of the maximum GWP for all concrete mixes installed in the project shall be less than the weighted average maximum GWP as specified above. Calculations shall be submitted for approval.

7. N/A

8. All concrete above grade, including slab on grade, deck fill, wall, topping slab, stair landing and tread, shall have 1.5 pounds of 3/4" long fibrous reinforcing per cubic yard of concrete.

9. Lean Concrete: Where specifically indicated, containing 2 sacks of cement per cubic yard of concrete. Use only where specifically called for.

10. Non-shrink Grout: ASTM C1107, cementitious, non-metallic, attaining a compressive strength of 8000 psi.

11. Concrete Mix Design Submittal: Prior to ordering concrete, submit for each compressive strength and type of concrete required designed, mix designs signed, and sealed by a registered Civil or Structural Engineer in State of California to Architect (Structural Engineer), Special Inspector and to Governing Code Authority complying with California Building Code, Chapter 19.

12. Construction Joint: Roughen surface to 1/4-inch amplitude. Clean, remove laitance, thoroughly wet and remove standing water before placing new concrete. Submit to the Architect (Structural Engineer) at least 14 days prior to placing concrete indicating locations of construction joints and extent of pours. Place joints at locations to minimize the effects of shrinkage as well as being placed at points that least impair the strength of the structure. Provide dowels as directed.

13. Embedments and Penetrations in Concrete: No penetration through structural concrete is permitted unless shown in these drawings or specifically accepted in writing by the Architect (Structural Engineer). Do not cut any reinforcing.
   A. Pipes, Sleeves, Conduits, and Ducts: Not permitted embedded or penetrating concrete spread footings, columns, walls or concrete cast over metal decking, except as shown in these drawings.
   B. Conduits Embedded in Structural Concrete Slabs: Not permitted unless limited to two layers of 1 inch, and 1/6 slab thickness. outside diameter conduits and smaller spaced at least 3 inches center to center and within middle third of slab thickness. No conduit embedded in concrete cast over metal decking is permitted. No aluminum conduit is permitted.

14. Chamfered Corners: Provide 3/4-inch chamfer at exposed corners of columns, beams and walls except where structural walls are laid flush with column or beam faces, unless detailed otherwise.

15. Curing: Maintain concrete above 50 degrees Fahrenheit and in a moist condition for a minimum of 7 days after placement unless otherwise accepted by the Architect (Structural Engineer).

16. Non-Structural Topping slab shall be normal weight concrete reinforced with 6x6-W3.5xW3.5 W.W.F. at the center line of the slab. See plans & details for information on concrete fill over metal deck.

17. The maximum size for a single elevated concrete slab pour shall be 25,000 sq. ft. and shall have a maximum length to depth ratio of 2:1.

18. The maximum water-soluble chloride ION (CI) content in concrete by percentage of weight cement is 0.30.

19. Where "Styrofoam" or "EPS" is indicated on the drawings, provide expanded polystyrene conforming to ASTM D6817 Type EPS12 with the following physical properties.
   A. Density (min): 0.70 lb/ft^3
   B. Compressive Resistance (min): 2.2 psi @ 1% strain
   C. Flexural Strength (min): 10.0 psi

METAL DECKING

1. Metal Decking and Accessories: Verco Manufacturing Company, type and gauge as indicated on structural drawings, ASTM A653-SS grade 50 minimum conforming to IAPMO report ER-2018, G60 coating, unless heavier galvanized coating is indicated in specifications. Run deck units continuous over three or more spans where possible, deck is designed for unshored construction, UNO. Provide vented deck where vapor impervious material occurs over concrete fill, see Architectural for locations.

2. Deck Welding: AWS D1.3 using prequalified procedures.
   A. Qualification of Welders: Welders shall be experienced in welding light-gauge steel and using prequalified procedures. Erector shall establish welding procedure for arc spot welding of metal decking to structural steel, for each gauge of decking to be used. Prior to deck erection, each welder shall be qualified using this procedure and witnessed by Special Inspector. See California Building Code, Chapter 22A and 17A, for additional qualification requirements.

3. Shop Drawings: Submit to Architect (Structural Engineer) for review. Shop drawings shall include layout of deck, type of deck, methods of attachment, and all deck openings larger than 1'-0".

4. Limits to Non-Structural Items Suspended From Metal Decking:
   A. Hangers supported by metal decking with structural concrete fill shall be anchored using products with valid evaluation report under applicable code.
      a. Limit hangers to the following applications: Acoustical ceilings, ducts no greater than 6 sq. feet cross sectional area, pipes no greater than 3 inch diameter. See typical detailing for further clarification of design intent.
      b. At duct and pipe distributions systems, limit hanger loads to concrete filled metal deck as follows: 250# maximum per metal deck span per 24" width. Support larger duct work and piping from structural beams as shown in typical details.
   B. Hangers supported by metal decking without structural concrete fill shall be anchored using products with valid evaluation report under applicable code.
      a. Limit hangers to the following applications: Acoustical ceilings, ducts no greater than 1.5 sq. feet cross sectional area, pipes no greater than 1.5 inch diameter. See typical detailing for further clarification of design intent.
      b. At duct and pipe distributions systems, limit hanger loads to metal deck w/o concrete fill as follows: 100# maximum per metal deck span per 24" width. Support larger duct work and piping from structural beams as shown in typical details.

5. Pre-punched Holes in Metal Decking and Accessories: Metal deck welding and installation of welded shear studs are not permitted through single layer sheets greater than 16 gauge (G90 MAX), nor through double layer sheets greater than 20 gauge (G60 MAX), nor through sheets with total galvanized coating thickness greater than 1.25 ounces per square foot. Provide pre-punched holes as necessary. Provide closure angle at all openings per typical details.

6. Excess Structural Concrete: Concrete filled metal decking and steel framing will deflect during placement of concrete. These deflections will require placement of concrete in excess of amount based on nominal dimensions in order to bring slab within tolerances of a horizontal plane. Provide excess concrete at no cost to Owner.

7. Deck shall be layed out such that low flutes land on each parallel support wherever possible. Provide filler deck accessory where low flutes do not align with parallel framing. Provide 2" minimum bearing at each support and 2" lap at ends of decking panels.

8. Composite slabs:
   A. See "Proprietary Anchorage and Fasteners" notes for welded headed studs.
   B. Stud welding, inspection and testing shall conform to AWS D1.1, CH. 7.
   C. 18 gauge or thicker decking shall not be lapped where welded studs are attached through decking.

REINFORCING STEEL

1. Reinforcing Steel: All bars shall be deformed.Table Notes:

Use/Location	Type/Grade	GWP Limit (unfabricated) (MTCO$_2$e/MT)	Notes
Standard Bars (#3 thru #6)	ASTM A615, Grade 60	0.89	-
Standard Bars (#7 and larger)	ASTM A615, Grade 60	0.89	-
Bars to be welded (#3 thru #6)	ASTM A706, Grade 60	0.89	-
Bars to be welded (#7 and larger)	ASTM A706, Grade 60	0.89	-
Smooth WWF	ASTM A1064, Fy = 65 ksi	-	A
Deformed wire stirrups	ASTM A1064, Fy = 65 ksi	-	B
Spiral reinforcing	ASTM A1064, Fy = 65 ksi	-	-

   A. Provide WWF in flat sheets only - do not use rolled mesh. Lap 1-1/2 wire spaces (1 foot minimum).
   B. Only D4 and larger are allowed.
   C. MT = Metric ton

2. Reinforcing shall be placed in accordance with the American Concrete Institute Standard 318 (ACI 318) and Concrete Reinforcing Steel Institute's (CRSI) "Manual of Standard Practice". Reinforcing shall be kept clean and free of rust.

3. Provide all accessories needed to support reinforcing in the positions shown in the drawings. Chairs and spacers for reinforcing shall be non-ferrous or plastic-coated when resting on exposed concrete surfaces.

4. Shop Drawings: ACI 318. Show reinforcing steel placement, including sizes, quantities, spacing, clearances, splice locations, lap lengths, and concrete coverage and submit to the Architect (Structural Engineer). Promptly notify the Architect (Structural Engineer) prior to developing shop drawings if insufficient clear distances between reinforcing steel and other congestion are encountered. Notify Special Inspector of adjustments made from approved Contract Documents which are indicated on accepted shop drawings that facilitate field placement of reinforcing steel and concrete. All bars shall be marked so that they can easily be identified by the project inspector after installation.

5. Lap Splices: At concrete, Provide Class B splices per Typical Bar Development Schedules UNO. At masonry, provide 72db lap splice length UNO. Splice bars only at locations indicated. If additional splice locations are proposed, promptly notify the Architect (Structural Engineer) prior to developing shop drawings.
   A. Splices in Walls: Locate splices in horizontal bars at well-staggered locations. Do not splice vertical bars except at horizontal supports such as floor and roof diaphragms.

6. Mechanical and Welded Splice: Mechanical Splices and Welded Splices are to be used only at the indicated locations. Notify the Architect (Structural Engineer) of all instances prior to developing shop drawings.
   A. Mechanical Splice: Mechanical couplers shall have a current Evaluation Report and satisfy ACI requirements for type 2 couplers for the applicable bar size/grade designation.
   B. Welded Splice: Welded splice shall develop at least 125 percent of the yield strength of the spliced bar for the applicable bar size and grade designation.

7. Minimum Clearances Between Parallel Reinforcing Steel, Including Distance Between Sets of Spliced Bars: 1 inch, 1 bar diameter, or 4/3 times the maximum aggregate size, whichever is greater. 1-1/2 inches, 1-1/2 bar diameters, or 4/3 times the maximum aggregate size, whichever is greater, at columns, piers, and pilasters only. For bundled bars, minimum clear distances between units of bundled bars shall be the same as single bars, except bar diameter is derived from the equivalent total area of the bundle.

8. Specified Concrete Coverage: Place bars as near to the concrete surface as the following specified coverages and in accordance with ACI 117:

A.	Slabs on Grade	Locate at the center of slab.
B.	Slabs Supporting Earth Above	1-1/2 inches from top.
C.	Formed Concrete Exposed to Earth or Weather	1-1/2 inches (#5 and smaller) 2 inches (#6 and larger)
D.	Concrete Poured Against Earth (Unformed)	3 inches
E.	Walls Above Grade, Exposed to Weather	1-1/2 inches (#5 and smaller) 2 inches (#6 and larger)
F.	Walls Above Grade, Not Exposed to Weather	3/4 inch (#11 and smaller) 1-1/2 inches (#14 and larger)
G.	Columns (Clear to Face of Ties)	1-1/2 inches
H.	Beams (Clear to Face of Ties)	1-1/2 inches
I.	Structural Slabs, Not Exposed to Weather (Top and Bottom)	1 inch (#8 and smaller) 1db (#9 and larger)
J.	Structural Slabs, Exposed to Weather	1-1/2 inches (#5 and smaller) 2 inches (#6 and larger)
K.	Structural Slabs over Void Forms	1 inch (top #8 and smaller); 1 db (#9 and larger) 2 inches (bottom)

1. Dowels between foundations and vertical wall & column bars shall match the size, grade and spacing of the column or wall vertical reinforcing and be lapped with a class B lap splice, UNO.

2. Dowels at Construction Joints: Provide dowels matching size and quantity of reinforcing steel interrupted at construction joints, unless detailed otherwise.

3. Placement of Bars in Walls (unless detailed otherwise): Place vertical bars closest to wall surfaces at curtains containing vertical and horizontal bars of the same size. In curtains with vertical and horizontal bars of different sizes or spacing, place the layer with the most steel area closest to the near wall surface.

4. Bars Terminating at Walls, Columns, Beams, and Foundations: Extend bars to within 2 inches (3 inches at concrete poured against earth) of the far face of the wall, column, beam, or foundation and provide a standard hook unless detailed otherwise.

5. Bars Interrupted by Structural Steel: Extend bars within 2 inches of the steel face and provide a standard hook unless detailed otherwise.

6. Welding: AWS D1.4, edition adopted by applicable code.
   A. Acceptable Reinforcing Steel for Welding: ASTM A706. If welding of reinforcing steel other than A706 is desired, submit a proposed procedure, indicating conformance with the Applicable Code and requirements of the Governing Code Authority, to the Architect (Structural Engineer) for acceptance and to the Governing Code Authority for approval prior to execution.
   B. Rebar to rebar weld is not allowed except where specifically indicated on plans. Provide electrode E80XX (80 ksi) where permitted.
   C. Welder Certification: As required by the Governing Code Authority.

7. See welding notes in the Structural Steel Section of these notes for additional requirements.

8. Bending: Bend cold according to typical details unless otherwise accepted by the Architect (Structural Engineer). Do not field-bend reinforcing steel bars embedded in concrete unless otherwise accepted in writing by the Architect (Structural Engineer).

9. In-plant fusion welding of holding wires to ties, stirrups and hoops in beams, columns and grade beams to preassemble reinforcing steel cages is permitted under the following conditions per CBC 2022 1903.8:
   A. Fusion welding is not allowed to longitudinal reinforcing steel in any beam, column or grade beam. The holding wire area shall not exceed 5% of the beam, column or grade beam cross sectional longitudinal steel area.
   B. Fusion welding of holding wires to the ends of the reinforcing steel placed in mats (spread footings, slab reinforcement, etc.) provided the fusion weld occurs within 6 bar diameters of the free end of the bar (e.g. not allowed at the end of coupled, t-headed or weld spliced bars).
   C. Fusion welding of holding wires shall not occur on a bent portion of a reinforcing bar. After holding wire has been fusion welded to a reinforcing bar, that bar may not be bent where the fusion weld occurs.
   D. Contractor to submit complete shop drawings indicating which members will use fusion welding process for preassembly. Provide complete details indicating the size of stirrups, holding wires and welding requirements.
   E. Holding wires shall conform to ASTM A1064.
   F. All reinforcing steel to be welded shall comply with ASTM A706 Grade 60.
      a. Contractor to submit complete shop welding program outlining the following: Type of specific fusion welding machine (i.e. Schnell IDEA 12/25 Machine, etc.)
      b. Periodic inspection of the in-plant welding.
   G. Fusion welded reinforcing steel shall have one tensile test taken from one specimen sampled at a rate of 2.5 tons or fraction thereof of each size of reinforcing steel fusion welded. No bend test is necessary. The specimen shall have a holding wire attached to it that need not be removed. The elongation requirements shall comply with the ASTM of reinforcing steel specified on the construction documents (e.g. if A615 is specified, but A706 is used due to the welding requirement, then A615 elongation requirements shall be satisfied).
   H. The use of fusion welding shall conform to ACI 318-19 26.6.4.
   I. If field conditions result in conflicts with other structural members (ex. anchor bolts) the rebar must be relocated in the field to avoid said conflicts.

DESIGN LOADING

1. Loading and Design Parameters:
   A. Live Load
      a. Floor / Roof Live Load: See legends as provided on loading plan sheets.
      b. Live Load Reduction:
         - Floor Live Load of 100 psf and below: General (Applicable Code Section 1607A.12.1)
         - Floor Live Load over 100 psf: Unreduced
         - Roof Live Load: General (Applicable Code Section 1607A.14.2)

   B. Wind Design Parameters
      Wind Speed Strength level, V: 100 MPH (STRENGTH)
      a. Wind Speed Allowable Stress, V_{asd} 78 MPH (ASD)
      b. Risk Category: III
      c. Exposure: C
      d. Enclosure Classification: Enclosed, Hub Canopy: Open
         - Internal Pressure Coefficient, GC_{pi}: +/- 0.18, Hub Canopy: 0.0
      e. Components and Cladding Wind Pressure:

      Hub Building (Middle School Building and MDF Building):

	EFFECTIVE AREA		
ZONE	10 SF	100 SF	500 SF

5	23.5 / -31.4 (psf)	20.1 / -24.4 (psf)	17.7 / -19.6 (psf)

      Loads indicated are strength-level loads (negative values indicate pressure away from the surface).

   C. Rain Loads
      a. Rain Intensity (15-minute), i: 2.84 (in/hr), 15-min duration/100-year return period

   D. Snow Loads Parameters:
      a. Ground snow load, p_g 0 PSF
      b. Flat-roof snow load, p_f 0 PSF
      c. Risk Category: III
      d. Snow importance factor, I_s 1.1
      e. Thermal factor, C_t 1.0
      f. Slope factor, C_s 1.0

   E. Project Seismic Design Parameters:
      a. Site Class: D
      b. Mapped Spectral Acceleration (S_s, S_1): 1.608g, 0.557 g (respectively)
      c. Site Specific Design Spectral Acceleration (S_{DS}, S_{D1}): 1.224g, 0.760 g (respectively)
      d. Site Coefficient (F_a, F_v): 1.142, 2.047 (respectively)
      e. Seismic Importance Factor I_e: 1.25
      f. Risk Category: III
      g. Seismic Design Category: D

      Gymnasium Building Seismic Design:

a. Basic Seismic Force Resisting System:	Steel Buckling-Restrained Braced Frames
b. Seismic Response Coefficient, C_s:	0.191 g
c. Analysis Procedure:	Modal Response Spectrum Analysis
d. Seismic Base Shear:	403 kips
e. Response Modification Factor R:	8
f. Overstrength Factor, Ω_o:	2.5
g. Deflection Amplification Factor, C_d:	5
h. Maximum Story Inelastic Drift:	Roof Floor: 1.0 in (North / South) 1.0 in (East / West) Second Floor: 1.5 in (North / South) 1.5 in (East / West) Vertical: No Irregularity
i. Irregularities:	Horizontal: Type 1a: Torsional Irregularity Type 2: Reentrant Corner Irregularity Type 3: Diaphragm Discontinuity Irregularity
j. Reducancy Factor, ρ:	ρ = 1.3 (North / South) 1.3 (East / West)
k. Building Mass:	2110 kips
m. Location of Seismic Base	At Top of Footing

      Hub Building (Middle School Building) Seismic Design:

a. Basic Seismic Force Resisting System:	Steel Buckling-Restrained Braced Frames
b. Seismic Response Coefficient, C_s:	0.191 g
c. Analysis Procedure:	Modal Response Spectrum Analysis
d. Seismic Base Shear:	103 kips
e. Response Modification Factor R:	8
f. Overstrength Factor, Ω_o:	2.5
g. Deflection Amplification Factor, C_d:	5
h. Maximum Story Inelastic Drift:	Roof Floor: 1.00 in (North / South) 0.75 in (East / West) Vertical: N/A
i. Irregularities:	Horizontal: Type 1a: Torsional Irregularity Type 2: Reentrant Corner Irregularity Type 5: Nonparallel System Irregularity
j. Reducancy Factor, ρ:	ρ = 1.3 (North / South) 1.3 (East / West)
k. Building Mass:	538 kips
m. Location of Seismic Base	At Top of Footing (- 1'-6")

      Hub Canopy Seismic Design:

a. Basic Seismic Force Resisting System:	Steel Special Cantilever Column System
b. Seismic Response Coefficient, C_s:	0.612 g
c. Analysis Procedure:	Modal Response Spectrum Analysis
d. Seismic Base Shear:	93.6 kips
e. Response Modification Factor R:	2.5
f. Overstrength Factor, Ω_o:	1.25
g. Deflection Amplification Factor, C_d:	2.5
h. Maximum Story Inelastic Drift:	Roof Floor: 4.5 in (North / South) 4.0 in (East / West)
i. Irregularities:	Vertical: N/A Horizontal: Type 5: Nonparallel System Irregularity
j. Reducancy Factor, ρ:	ρ = 1.0 (North / South) 1.0 (East / West)
k. Building Mass:	153 kips
m. Location of Seismic Base	At Top of Caisson (- 1'-0")

      Shade Pavillion Seismic Design:

a. Basic Seismic Force Resisting System:	Steel Special Cantilever Column System
b. Seismic Response Coefficient, Cs:	0.612 g
c. Analysis Procedure:	Equivalent Lateral Force Procedure
d. Seismic Base Shear:	6.2 kips
e. Response Modification Factor R:	2.5
f. Overstrength Factor, Oo:	1.25
g. Deflection Amplification Factor, Cd:	2.5
h. Maximum Story Inelastic Drift:	Roof Floor: 2.1 in (North / South) 2.1 in (East / West)
i. Irregularities:	Vertical: N/A Horizontal: N/A
j. Reducancy Factor, p:	p = 1.3 (North / South) 1.3 (East / West)
k. Building Mass:	10 kips
m. Location of Seismic Base	At Top of Caisson

DEFERRED SUBMITTAL ITEMS ANCHORED OR SUPPORTED BY STRUCTURE

1. Design Responsibility: Contractor to design and obtain separate Governing Code Authority approval for deferred approval items noted on Gx series sheets.

2. Shop Drawings and Structural Calculations: Submit design plans, details and calculations of deferred submittal items signed and sealed by a structural engineer registered in State of California to Architect (Structural Engineer) for acceptance and to Governing Code Authority for approval prior to fabrication.

3. Design: Design components for imposed forces including lateral restraint complying with Applicable Code, Contract Documents, and applicable portions of ASI Specifications. If building Seismic Force Resisting System (SFRS) is used for lateral restraint, indicate load paths to building lateral resisting system in calculations and show connection forces on shop drawings. Where building provides vertical support, indicate loads and load paths to building in calculations and show connection forces on shop drawings. Dead load elements at lowest level of connection uno Design loads are as follows:
   A. Dead load: Self weight of deferred system (including supported components of other systems).
   B. Live load: Per applicable code.
   C. Seismic and wind loads: Per applicable code. See Design Loading section of General Notes
   D. Design Movement: Lateral Movement: Design Loading (Section E) of General Notes
      Vertical Movement: Live Load Deflection of L/360

4. Stabilizing Elements at Connections to Structural Members: Design connections of deferred submittal items to supporting structure such that torsion in supporting elements is avoided wherever possible. Where torsion in supporting element is resulted, provide beam bottom flange brace per detail 17 or 18/2-S6.11 at each connection point.

QUALITY ASSURANCE (STRUCTURAL OBSERVATION, MATERIALS TESTING, and SPECIAL INSPECTION)

1. Structural Observation:
   A. The Architect (Structural Engineer) of record will perform visual observation of the construction as required CAC 4-333 and 4-341 in accordance with the governing code. These visual observations shall not be considered a substitute for special inspections.
   B. Coordination Responsibilities of Contractor: Notify Architect (Structural Engineer) 48 hours in advance of critical stages of construction indicated below so visits may be scheduled by Structural Observer. Failure by Contractor to meet observation schedule may require removal of subsequent Work for observation. Contractor to bear costs of removal and replacement of finished Work or framing damaged by removal process or as required for corrective action and for any associated scheduling delays.
      Critical stages of construction requiring structural observation:
      1. Prior to pouring first foundation at each of the structures.
      2. Prior to pouring first concrete filled metal deck.
      3. After structural steel erection, Prior to application of architectural furring.
      4. After roof deck welded off.
   C. Pre-construction Meeting: Owner may coordinate and call for meeting between Architect (Structural Engineer) responsible for structural design, Structural Observer, Contractor, affected subcontractors and Special Inspector. Structural observer will preside over this meeting. Purpose of meeting is to identify major structural elements and connections that affect vertical and lateral load resisting systems of structure and to review schedule of Structural Observation, Materials Testing, and Special Inspection of Project.

2. Mill Test Reports Certifying Materials: Contractor to submit mill test reports certifying reinforcing steel, and structural steel are of identifiable tested stock to Owner, Special Inspector, Architect (Structural Engineer) and, upon request, to Governing Code Authority. Ensure materials are properly tagged for identification. If mill test reports cannot be made available or if material cannot be identified, Testing Laboratory will perform tests as directed by Architect (Structural Engineer). Contractor shall pay Testing Laboratory for costs related to tests and inspections of unidentifiable materials or materials furnished without mill test reports, materials found deficient after initial tests and inspections, or materials replacing deficient materials.
   A. Ultrasonic Examination of Heavy Rolled Shapes and Thick Plates at Proposed Welded Moment Connections: Where complete penetration groove welds occur at Groups 4 and 5 structural steel shapes, as defined in ASTM A6, and plates exceeding 2 inches thick, submit mill test reports to Architect (Structural Engineer) and, upon request, to Governing Code Authority. Mill test reports shall certify that Charpy V-notch testing was conducted in compliance with ASTM A6, Supplementary Requirement S5, including impact test complying with ASTM A673 at frequency P with minimum average value of 20 ft.-lbs. absorbed energy at 70 degrees Fahrenheit.

3. Weld Testing and Inspection: Testing Laboratory will submit weld test results to Owner, Contractor, Architect (Structural Engineer) and to Governing Code Authority. See Specifications for testing requirements not indicated on structural drawings.
   A. Structural Steel Welding: Apart from visual inspection and review of fabrication and erection reports of fabricator/erector's own quality control testing and inspection, Owner's Testing Laboratory will perform indicated shop and field inspection and testing. Testing Laboratory will be AWS Q C.-1 certified and will provide inspectors for continuous inspection of steel fabrication and erection of structural welding. Shop and field testing of materials and welding will be as follows:
      a. Ultrasonic testing is required for all (100%) and complete penetration welds. Test groove welding on continuity plates by ultrasonic testing after beam flange weld connection. Testing shall occur after completed welds have cooled to ambient temperature. Weld backing removal areas and fillet welds shall be subjected to magnetic particle examination.
      b. Base metal thicker than 1-1/2 inches, subjected to through thickness weld shrinkage, will be ultrasonically tested directly behind such welds after welds have cooled to ambient temperature.
      c. Welds shall be visually inspected and periodically measured (15 percent minimum).
      d. Check 10 percent of fillet welds by magnetic particle (ASTM 109 method). Check 25 percent of continuity plate fillet welds by magnetic particle, UNO. At continuity plates in moment connections (where CJP is used on one or more plate ends), 100 percent of fillet welds shall be tested by magnetic particle.
      e. Ultrasonically test column flanges located at proposed welded moment connections, continuity plates, doubler plates and base plates where column flange or plate thickness exceeds 1-1/2 inches. Test for evidence of laminations, inclusions or other discontinuities in accordance with ASTM A435, straight beam ultrasonic examination of steel plates, or ASTM A898, straight beam ultrasonic examination of rolled steel structural shapes, as applicable. Test zone to include area 6 inches above and below each beam flange connection. For plates, any discontinuity causing a total loss of back reflection not contained within 3-inch diameter circle, or one-half thickness of plate, whichever is greater, will be rejected. For rolled shapes, ASTM A898, Level I criteria applies. Testing will be performed on material prior to fabrication, after fabrication, and after final welding of beam.
      f. f. k-Area welds shall be MT'd no sooner than 48 hours after completion of weld.
      g. Amperage, voltage, polarity and electrode stick out will be verified for compliance with electrode manufacturer's recommendations.

4. Special Inspection: Per DSA-103 and chapter 17A of CBC.

GENERAL

1. Authority Having Jurisdiction (AHJ): Division of the State Architect (DSA SS)
   Applicable Code: 2022 California Building Code (CBC) as modified by AHJ. References to industry standards herein shall be latest edition as adopted by Applicable Code.

2. Field Verification: Field verify existing conditions and dimensions prior to construction. Promptly notify Architect (Structural Engineer) in case of discrepancies.

3. Design Intent: Contract Documents indicate design intent for structure in its completed state. They do not indicate method of construction. Promptly notify Architect (Structural Engineer), prior to proceeding with Work, if design intent requires further clarification.

4. Deviations, Modifications and Substitutions to Approved Structural Drawings: Must be accepted in writing by Architect (Structural Engineer) and approved by Governing Code Authority. No deviation, modification or substitution will be accepted via shop drawing review.

5. Procedures of Construction: Contractor is responsible for procedures of construction complying with national, state and local safety ordinances. Site visits (including Structural Observation) by Architect (Structural Engineer) do not constitute supervision of methods of construction.
   A. Protection of Utilities: Locate existing utilities, including those not shown on Contract Documents, and protect them from damage. Contractor bears expense of repair or replacement of utilities in conjunction with excavation of Work.
   B. Excavations: Protect structure, adjacent structures, adjacent properties, streets, and utilities during excavation utilizing lagging, shoring, underpinning and related procedures as may be required. Provide necessary supports for soil at sides of excavations. Contractor and affected trades shall refer to Geotechnical Report for more information.
   C. Protection of Structure: Provide necessary measures to protect structure and adjacent buildings during execution of Work.
   D. Contractor Proposed Revisions: Where a revision of structural design or connection is proposed by Contractor to accommodate construction tolerances, construction sequence and/or dimension modifications, Contractor shall retain a structural engineer licensed in State of California to perform design. Submit stamped and signed design drawings and calculations to the Architect (Structural Engineer) for review and the Governing Code Authority for approval.
   E. Erection Plans: Determine phases of Work requiring erection plans according to applicable safety regulations. Maintain certified copies of erection plans at site during construction.
   F. Shoring, Bracing, and Other Temporary Supports: Design and erect shoring, bracing, and other temporary supports where structure has not attained design strength and as required for safe erection. Ensure floor, roof, and wall members are securely shored and braced during construction. Provide shoring at elevated beams and slabs supporting concrete or masonry walls during and after pour until wall attains design strength.
   G. Temporary Loading: Ensure construction loads do not exceed indicated design live load values. Notify affected sub-contractor trades of these design load limits.
   H. Fabrication, Shipment, and Erection of Structural Steel: Ensure stresses occurring during fabrication, shipment, and erection of structural steel are temporary and are less than design and allowable stress capacities of individual members. Do not impair full design and load carrying capacity of members due to fabrication, shipment or erection. Contractor is responsible for controlling erection sequence, erection procedure, temperature differentials and weld shrinkage to minimize residue stresses. Provide additional materials for the erection of structural steel such as temporary bracing and guy cables as may be necessary at no additional cost. Remove these materials unless approved in writing by Owner. Do not tighten bolts in typical beam to column connections for erection purposes.
   I. Securing Reinforcing Steel, Dowels, Anchor Bolts and Embeds: Firmly support and accurately place complying with ACI standards prior to casting concrete or grout in masonry walls. Use ties and support bars in addition to reinforcing steel shown where necessary. No welding of reinforcing steel, including tack welding, is permitted unless otherwise accepted in writing by Architect (Structural Engineer). Provide plastic or plastic coated chairs and spacers when resting on exposed surfaces.
   J. Coordination Responsibility: Contractor is responsible for coordination of Work including that of sub-contractor trades.
   K. Core drilling of hardened concrete shall only be done after specific review by Architect (Structural Engineer) Core drilling shall not cut any reinforcing. Concrete coverage for reinforcement as described in the Reinforcing Steel section of General Notes shall be maintained at locations of cores.

6. Submittals: Submit to Architect (Structural Engineer) as indicated on structural drawings and specifications. General Contractor shall review submittal for completeness and compliance with Contract Documents prior to submission.
   A. Request for Information (RFI) Submittals: Accompany RFI's with partial structural foundation or framing plans showing location in question and affected structural members. Copy partial plan from structural drawings and indicate grid line locations and floor level. Also provide properly drawn engineering sketches illustrating issues and Contractor's proposed solutions. Photographs are not acceptable substitutes to engineering sketches.
   B. Composite Slab Penetration Submittal: Submit to Architect (Structural Engineer) for each floor indicating size and location of each slab penetration and opening as necessary by all affected trades. Submit penetration plans together with corresponding metal decking or reinforcing steel shop drawings. Submit written statement from Special Inspector that no additional penetrations or openings were added to those shown in penetration submittal.
   C. Concrete and Masonry Wall Penetration Submittal: Submit to Architect (Structural Engineer) for each wall indicating size and location of each wall penetration and opening as necessary by all affected trades. Submit penetration elevations together with corresponding reinforcing steel shop drawings. Submit written statement from Special Inspector that no additional penetrations or openings were added to those shown in penetration submittal.

7. Contract Documents Use: Review Contract Documents in their entirety before performing structural related Work and before developing shop drawings. Bring discrepancies to immediate attention of Architect (Structural Engineer) before starting Work.
   A. Scaling of Drawings: Not permitted.
   B. Additional Structural Requirements: See specifications.
   C. Building Geometry: See architectural drawings for building geometry including, but not limited to, top of floor and roof elevations; depressions; slopes; curbs; drains; trenches; slab and deck edge locations; wall overall dimensions; and size and locations of openings in floors, roof, and walls.
   D. Non-structural Items Requiring Special Provisions: See architectural, mechanical, plumbing, and electrical drawings for non-structural items requiring special provisions during construction. They include, but are not limited to, non-structural walls; size and location of openings and sleeves penetrating structure; size and location of concrete curbs and pads; and size and location of piping, ductwork, and equipment anchorages mounted or suspended from structure. Verify exact size and location of equipment with equipment manufacturer.
   E. Work shown is new unless noted as existing. (E).

8. Materials: Furnish and install in compliance with legally constituted public authorities having jurisdiction including county and local ordinances and safety orders of State Industrial Accident Commission, OHSA. The Architect (Structural Engineer) and Owner accept no responsibility for the contractors failure to comply with these requirements.

9. Penetrations, Embedments, and Openings in Structural Members: No penet
